- Sprites can loop continuously or just once
- If you want to change the way something looks in this new UI,
chances are that you can change it via the Configuration menu.

- Save Game management - delete save game files

- Samba/NetBIOS sharing support (read roms from your PC)

- Relax Network Sharing (read roms from your PC)

- Play MP3 or M3U playlists in the background
(Can also read MP3/M3U from across Samba/Relax shares.)

- User definable save directory. If you don't like the default of
E:SAVESATARIXLBOX you can change it via the ATARIXLBOX.INI file

- Take in-game screenshots and display them on the game selection list

- New UI feature - auto-screenshot capture mode. When enabled, the emu
will start taking screenshots at a user-defined interval. Useful for
ripping sprites/animation.

- Hardware filtering options : Point, Bilinear, Trilinear, Anisotropic

- Graphics filters :
+ 2xSai
+ Super 2xSai
+ Eagle
+ Super Eagle
+ SuperScale
+ AdvanceMame 2x
+ Simple 2x
+ 2xSai Scanline
+ Super 2xSai Scanline
+ Eagle Scanline
+ Super Eagle Scanline
+ SuperScale Scanline

- Record/Playback feature - record your gameplay in the emu and then
play it back again. Record up to 10 minutes of gameplay.

- Every single in-game command is fully customizable on any of the
four joypad controllers.

- Map any emulator or UI command to a single button or a combination of
two buttons. (e.g. RTrigger+LTrigger = Save State)

- Autofire capabilities for any emulator button on any controller

- One-button combos (define a series of emulator commands to be played
back when you press a user-definable XBox controller combination.)
(E.g. Press RTrigger+LTrigger to execute the command string
A,B,A,B,Up,Down,Left,Right)

- Traverse any directory on any drive ( Continue selecting the parent
directory entry on the file selection list to get the drive selection
list. Selectable drives are C, D, E, F, R, X, Y, Z, and SMB.
R is the CDROM drive. SMB is the samba share you have defined in your
ATARIXLBOX.ini file.) Press Y from any file-listing screen to go up one
directory level.

- All UI commands (save state, load state, screenshot, etc) can be
invoked from the Options/Pause menu as well as in-game via your
customized joypad mappings.

- Can be invoked from a command-line to directly run a game from a front-end
or dashboard and bypass the user-selection screens. (Only if the frontend
or dashboard supports this feature.)

- Can return to the launching program *if* the launching program supports this
feature. For example, if the custom-launch routines are incorporated into
a new frontend, that frontend could launch ATARIXLBOX and when you exit
ATARIXLBOX, that frontend can be automatically reloaded.

It worked just fine for me. I suspect that when I was using it, there were a
few other users logged in 'cuz it was running pretty slow, but other than
that, fine.

If anyone's interested in Atari ephemera there's an mp3 of an early 80's vinyl record at the 365 days project - it's pretty bad ;) but has some familiar sounds mixed in. There's "Fly, Yar Warriors", "Missile Command" and the Atari Theme.

http://www.otisfodder.com/365days/archive/246.html

Thanks. I believe the host was down or overloaded when I tried. I've tried since
then with better luck.

The Colossal Computer Cartoon Book is now on the Web at AtariArchives.org.

Published in 1977 by Creative Computing, the Colossal Computer Cartoon Book includes more than 250 cartoons and comics about computers and technology. Most of the cartoons in the book stand the test of time -- despite being first published 26 years ago, they remain as funny and relevant as the day they were drawn.

http://www.atariarchives.org/cartoon/

This is the 20th classic computing book to be made available at AtariArchives.org.

What is involved to get this to work on the XBOX? A cracked XBOX or will any one work? I am not into the XBOX scene too much I am afraid. Mine is collecting dust at the moment, but would be nice to use this on it!

I have listed my other XF-551 diskette drive for sale on eBay. Since I am needing to clear out my ATARI stuff I have lowered the reserve price.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2751847021

If you are looking for ATARI software or hardware check out my listings on my website - http://www33.brinkster.com/myatari4sale/

If you see something you want but think its priced too high make me a counter offer!

I believe I have the DREADNAUGHT FACTOR and it is for sale. This is
the one where you fly over the space battleship and try to take out
its engines and defenses, correct? After each pass you are
automatically positioned for another run in front of the battleship.

I am wondering the same thing. I play my Xbox alot as well as my
Atari Jaguar on my widescreen TV, so I would just love an Atari 8-
bit emulator for it.

Well I just got my SIO2PC cable and it works well. I dumped my 16mb hard disk to an image and MAN it takes along time (serial). I've been looking at alternatives and am thinking of a hard disk via MyIDE. I was thinking of sio2ide but I don't think it would be any quicker. What does everyone recommend? Also when I setup my image I use SpartaDos and just used XINIT to format it. Does that sound right? Just curious...

While playing Tempest just now, it reminded me of the movie "Night Of
The Comet", a typical 1980's gem about Valley Girls being amongst the
last survivors of a comet's devasating effect. One of the girls played
an arcade game and her high score kept getting topped by someone with
the initials "DMK". I am pretty certain that Tempest was the game that
they were competing on. Can anyone verify or refute?

Yes it was Tempest. There are also a couple of Atari games (hard to make
out
but at least one looks like Asteroids) that are there with the Tempest
machine.
Here are a few movie snapshots:

## 5043. 1050 drive-disks won't spin due to tightness

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-06 03:43:42 UTC
From: frankodragon1@yahoo.com
Message-ID: <d50c8e14.0309051943.2f49802a@posting.google.com>
Source record: 19406

I have this weird problem with my 1050 drive. I put a disk in, and it won't spin. But when I take out the disk, it spins. I'm assuming there's something clamping down onto the disk too tight--there's a metal lip with a sponge-like material under it where the disk rests and that maybe the culprit? Any ideas what and how to adjust?

Thanks for the verify; I am glad that I didn't hallucinate it. BTW, that looks like Asteroids on the left, Tempest in the center, and Asteroids Deluxe on the right. Leaning against the counter is a decent looking gal with 1980's hair.

Look at the underside of the drive mechanism while its operating.
Your drive belt may be loose. It may have enough grip to spin with
nothing in the drive, but then slips when it has to turn a disk.

Not trying to get under your skin, but... That's pretty ironic. The two
systems in history with notoriously HUGE first gen controllers...

I didn't have my Jaguar all that long, but did they ever actually make a
smaller controller for the thing? I hated the system because of it's
humongous controller. Other than that, nothing wrong with it, well, aside
from the initial price of the system and it's CD drive...

Obvioulsy the most gay system is the one Lord Teviolus uses the most freuently. It's the system he dreams about being connected with when his boyfriend is not around.

BTW, I never have liked the Z80 as much as a 6502, except for computers like the MSX's and Speccy's and such why use a Z80 when you could use a 286? Why use a 6502 when you can use a 68000... Dam! Why do I think about stuff like this.... Where's my copy of Boulderdash anyhow...

I and anybody else here could easily kick you ass Lord Teviolus, why dont you just wear a sign that says "Hack Me!"

An interesting conclusion.... thus whether you're gay or not has nothing
to do with your own sexual preferences but is merely matter of whether
others have wet gay dreams about you ??????

Were you able to take advantage of 3X speed in APE or Atari 810? Anything
using SIO will be slower than using the parallel bus. And 3X SIO is about as
good as it gets on NTSC systems. If you want the fastest backup speed, backing
up to a ZIP drive (or hard drive to hard drive) is a really fast alternative.
(Requires Black Box Interface for ZIP's.)

Hello Atari 8 bits fans!!!

I've put all (allmost) the disk I have on this web page :
http://the-redraven-site.chez.tiscali.fr/
I don't know if my provider appouve that but as we know, it's more like
abandonnware
(but really good things!!!).
Most of my disks can be find elsewhere but I'm pretty sure some NOT...

If you download some of them, please mail for thanks or ...

The 3 first pages are the list and the last one, the download.

Have fun!

Hi,

I just added a ZIP drive to my black-box. It works great. My old harddisk
just crashed so I added a new 2Gb harddisk to it and will use the ZIP as
backup. It's very quick.

Secondly you need to modify the black-box to support the ZIP drive. After
that you need to manually configure it in de controller list.
The mod on the black-box = parity mod & termination power mod. But all this
can be done very easy.

I only had the parity mod and it didn't work after the termination power mod
it works great.

TXG/MNX

That is the read/write head. Don't screw with it. If it is just 1 or 2 disks, their jackets may be squeezing the disk medium due to being stored while tightly stuffed in a box. Carefully insert a fat knitting needle between the jacket & disk medium via the center hole and spread the jacket without scratching the medium. If this gets it working, make a backup copy immediately. Paul

From: "Brandon J. Van Every" <vanevery@3DProgrammer.com>
Message-ID: <bje52t$hskje$1@ID-203719.news.uni-berlin.de>
Source record: 19418

Hi, I'm using Atari800Win Plus 3.1 to run Seven Cities Of Gold. I can't make my ship go any faster than half speed! To make my ship go faster, I believe I'm supposed to (1) push the joystick in a particular direction (2) HOLD DOWN the joystick button. But I'm thinking maybe the emulator isn't set up to understand this maneuver? Simple joystick button pressing works fine for everything else. I am using the keypad to map the joystick. I tried using arrow keys + right-CTRL for the button, but it didn't improve anything.

Your assumption may be correct IF some else has been in there and
replaced the original foam which had the pressure of an angel's kiss
with weather stripping for the garage door. Replace the foam with
the softest stuff you can find and even then you may need to
bevel it so that a very thin area of contact with the floppy
is achieved.

I've found that for my drives, padding up the proper height for the
platform just underneath that foam helps more than any other single
adjustment as far as reliable read/write operation goes. If while
using reflected light with a disk spinning in the drive, you can
see a dimple where the head/pressure pad is, then you will get
better results if an adjusment is made to the platform's height.
Mine always need a section of credit card or thick cardboard
in there to achive a 'flat' disk in operation. First thing I look
at when a drive has read/write troubles and often that's all I
need to do to fix it too. That and replace the foam, often the
the original stuff just falls off.

Hi all. Does anyone know why when doing a copy of files from a hard disk to a pc via sio2pc it would just stop and the only way to resume is to hit the break key? Also once in awhile it sputters while the pc responds and it causes the destination file to be 0k. Any help would be appreciated. Think i'm going to try APE.

Timing problems, unless you can make it worse by wiggling the wiring
a bit then suspect the cable. Try a different software package and see
if that helps. If every SIO2PC program gives you the same hassle, then go
back to suspecting the hardware.

# 5061. Tricks to Seven Cities Of Gold?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-08 03:12:58 UTC
From: "Brandon J. Van Every" <vanevery@3DProgrammer.com>
Message-ID: <bjgri0$ipe7u$1@ID-203719.news.uni-berlin.de>
Source record: 19424

I played Seven Cities Of Gold to death as a kid. And I revisited it this weekend and thought, "Huh, well, that was nice for its time." Didn't really see the point in continuing after exploring about half a continent on Master level.

What I want to know is, did I miss any trick or feature in the game? The best thing I remember doing as a kid, was one time I managed to convert the entire Inca empire to Christianity. I didn't know how I did it. But somehow, the Inca emperor converted and then all I had to do was walk into places to take the gold. I'm wondering if there's some textbook way to always reproduce this result, or if you just get lucky every once in awhile and that was my time to get lucky. If the latter, I'll rest on my laurels. :-)

I've wondered how much mileage you can get out of Amazing the natives for this purpose. Seems like trading and combat reduces the amount you can Amaze them. I wonder if I could land, find the Incas, go straight to their capital, Amaze them, and get all the money for nuthin' ?

I found lost cities and gold mines no problemo. Don't think I missed anything there.

# 5062. Hacking/Phreaking/BBS Software for Atari 8-bit Wanted - will BUY!

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-08 13:56:17 UTC
From: wave_baby1971@yahoo.com
Message-ID: <ddccf071.0309080556.17008b33@posting.google.com>
Source record: 19425

Greetings..

I have posted to this group about this subject before, but it's been over a year, so I thought another post would not be rude.

I grew up on Atari 8-bit during the early to mid 80's, and at that time, was quite the collector of the utilities that some people used to hack phone codes, computer passwords, etc, that were made for the Atari.

Some of these programs included TUFF Hacker, CodeSuck, and The Happy Hacker (which was a tone generator)..

I was also quite into the various BBS software that was out there - which I know some of which can be found on the web, but programs like Marshware, etc, are not found anywhere.

I would like to create a website that remembers these softwares, and also archives them for others to find. I was wondering if anyone here had any of these types of programs (especially the hack/phreak programs) for the Atari 8-bit line - and if so, would they be willing to copy and send them to me, or even allow me to BUY the disks.

I appreciate any help or response - and while I realize that the hacking/phreaking apps were used to break the law at one time - I assure you I have no interest in trying to duplicate those actions today.

Allen

I don't think I have them anymore, but if you find one for the 1030
modem that was written by "Freddie", let me know, that was me :-) It
was so long ago I don't even remember the name of the program.

I'm in the same boat. I wrote a lot of these programs and now
they are all lost. I would love to see a copy of 'baby blue' for
the ST or my original carrier/dialtone scanner for the 8-bit.

If you get anything together please post the URL here :)

Steve

I have TuffHack 8.2 and a program called Lightning Hacker (that I think is on a damaged disk.) I'm trying to get it from my disk to ATR, but I'm having some problems (timeout errors writing mainly, using the shareware version of APE--sorry Steve no money to register it yet, but I will eventually, it is very cool.)

I'm going to try cutting out some devices in the SIO daisy chain and see if that makes any difference...

Source record: 19431

At the start of the game, take your ship in a south-west trajectory. It will take you to the eastern side of Brazil. As soon as you hit land, go north just a tad until you find the entrance to Amazon river. There is a small village just north of the entrance, go there to get some bearers.

Follow the river west. About the third or fourth river leading down, follow it and about at the bottom, head South-West. It takes you right to the capital.

The capital is noticeable in the beginner level, or by a clump of mountains in the shape of a crescent moon, or a quarter pie. In any case, it has a little color spot in the center when you see the city, indicating the capital. The 'chief' has a pointed crown.

Walk in, and offer gifts to your heart's delight. Trade. Leave. Repeat. And repeat. And repeat. And repeat. And repeat. Until you have converted him.

Be sure to have enough men to leave there, I believe it would take more than 100. Take all the gold, return to Europe. Get about 30 ships, filled with men, as everywhere you go they will ask to convert and you will need plenty of men.

Remember to leave some men on the ship in the intermediate and advanced levels or the ship may leave you behind. This happened to me once. Kinda sucks.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I agree with you whol heartedly. To me, the Atari 8-bits are the
best and deserve the new hardware that the others are enjoying. We
need people to develope/make new hardware who are not interested
in making money, but want the Atari 8-bit machine to still make it
in today's computer world. I would love to see an Ethernet piece
of hardware that would allow me to connect my 130XE to my local
Lan. That would be excellent.

Yes....!
If the the USB design was originally based on the Atari port design,
can a USB ethernet device be ported to the 8-bits

> Has anyone written a minigame not bigger than 1024 Bytes of code ?

Up to this date, Matthias Luedtke has submitted one 1K game for the
Atari 800 in this year's MiniGame compo. Last year there was no entry,
and two years ago there was one 2K entry.

> I've written some mingames in the past,some are rubbish , some are
> good.

Are those suitable for entering the compo maybe?

> Ok , it's more a better 3D labyrinth game,but it's only 1K of code.

It sounds quite interesting. How big is the complete game?

DANG!! much better responses than last time.. Thank you guys SO much.

TUFFHACKER 8.2 would rock, as would anything else you can find.

I do have BABYBLUE lying around, and may also have breeblebox laying
around for the ST.

Would any of you be interested in being on a mailing list that is
comprised of people who are interested in these types of apps, and
also interested in discussing this realm of Atari 8 bits (and even
ST's)?

If so - drop me an email... wave_baby1971@yahoo.com

please let me know if you are able to get any of those files to ATR,
or if you could copy them to disk and send them to me...

Do you see any value in selling the actual development engine for
other users / developers in helping produce games for the 8-bit / ST
platform....
Good tools is sometimes the catalyst to get things going....!
example: my kid's love to use map editors, etc for PC based games....
Just add some imagination.....

Eight-bit machines HAVE done "Populous". The SEGA Master System for one.

> That means there's is less data on the 8 Bits.
>
> Do you think the isometric 3D graphics of Populous would be a problem
> or the AI of the game (many people running around) ?
[snip]

I think the main problem aside from the need for RAM, is the lack of colour resolution. On a C64, even in multicolour bitmap the landscape would be restricted to 4 colours because of the different elevations. There is no guarantee that the greys of a building will not clash with the greens of grass and trees. The minimum colours would be blue (water), lt Green (grass), green (trees), grey (buildings), brown or black (earth). White (for stipple shading and people?). And remember that one of those colour sources will be the background colour and needs to be selected carefully with regards to the non-landscape screen elements.

Of course a 7-multicolour sprite wide psuedo bitmap overlay can provide another 3 colours (the 8th sprite is needed for the cursor), but the landscape would be restricted to a screen width of 21 chars (84 pixels).

Other people have asked similar questions: Here's one thread:

You may have noticed occasional postings here by the organizer of
the Silicon Valley (West Coast) and Boston (East Coast) Vintage Com-
puter Festivals. I'm hoping that someday he might organize a Mid-
west event. If I hear of anything happening, I'll be sure to post
news about it here on the 8-bit newsgroup.

Of course, how much Atari presence there might be at such an
event may depend in large part on us Atarians. If such an event
ever takes place, then it'll be up to us to DO something at the
event in order to "show the flag."

Zothen Runecaster asked about Atari shows! Well, don't forget
the annual Columbus Swap Meet is this Saturday, September 13!!

Here's a reminder: 9 a.m. to 3 p.m. at the Oakland Park Commun-
ity Center, 980 Lenore St., Columbus, Ohio, USA.

Admission: $4 per person, or $6 for a table.

Contact: rarenz at columbus dot rr dot com.

Is this the biggest Atari convention left in this country
these days? Or in all of North America? Can anybody beat it?
Make your travel plans now! Get those plane tickets! Board
that Amtrak train this minute! Gas up and start driving! Follow
the signs or follow the cars to the Columbus Swap Meet! We'll
see you there!!!

Does it have to be a good reason or just what Atari said?

#1 reason has to be because they believed 8 bit systems were dead and the future was going to be 16 bit.

That they even came out with the XE was kind of amazing IMO. I have heard that the only reason why we got the XF551 was because of some legal action. Somebody filed a lawsuit against someone else<Atari vs. Nintendo> over advertizing. ~Somebody Atari said Nintendo wasn't a computer and the XE was because it had a disk drive. Somebody at Nintedo said the XE wasn't a computer since Atari didn't make a drive and PRESTO! XF551 sees the light of day.

I would love to see a screenshot of what you manage to do using PM
graphics to embellish the screens. I had a similar idea for a game I
was working on, "the Dungeon from Hell." However have not managed to
get that going. If you would like to take a look at my game it's at:

http://linux.tc3net.com/daclmi/basic02.html

However there is not much there at all. Just walking around in five or
six cells. The graphics concept and movement interface are okay
though.

Certainly... you will need lots and lots and lots of gold. It is pretty expensive.

There is a town just south of the castle, I would guess about 15 paces south, then 10 paces to the east (to the right) [One game actually had east and west mixed up]. It is on an island, separated by just one single square of water from the main land. I usually like placing a ship there so I can walk back and forth at will across the ship. In any case, go to the town and enter it through the maze to the south (to save yourself a key). Then head past the door (you will need a key here) to the center of the town and head south again. There will be another maze. Go through there and toward the back, "BRIBE" the guard. He will leave and there will be a ton of gold waiting there for you to grab to your heart's delight. If you have the Mark of Force, you can go through the force field and grab even more gold.

Once you are rich, take your ship and find the whirlpool and dive right in. You will need keys, but even more you will need gold, wits, and probably some gems. There are four shrines there. Some are pretty well guarded, I think the shrine of wisdom and intelligent is on the right hand side of the map and less guarded. I think strength is guarded pretty well. I think the other once was dexterity, on the bottom left.

If I recall correctly, a bug in the game allows you to "mount" the wild horses in the northern-left side of the screen, but you will still be attacked by the other groups as you mount one.

I believe the island was called Sosaria.

To get off the island, there is a pirate ship to the south-west... take it and enter the whirlpool again.

# 5093. Good News - Holme's Web Site CDs and a Web Site

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-10 07:43:21 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <9259f5f6db2fadf94e5100d6aefb078a@news.teranews.com>
Source record: 19256

Greetings All,
I am expecting a brand new CD/DVD burner to be coming in any day now. What does this mean? It means, since I also upgraded the computer, that I can now burn CDs without making a large amount of coasters.

It also means I will be able burn the 800MB CDs and I can do it in less time too. What does that mean for you?

For those that have not yet gotten a copy of the Holme's Web Site CDs, I can now make them cheaper and pass the savings on.

$9.95 for a set of 3 CDs. This includes standard shipping. It may be more for international or 'special' shipping.

On another note... anyone want to host a web site?

I am quite certain that I can create a CGI script written in PERL (or some other language) that can read the contents of a hard drive (or CD) and generate an HTML list of the contents available for download, a little similar to the HTML listing that Holme's had on his own site.

Using a CGI script would mean little or no maintenance. All a person would have to do to update a contents list would be merely to 'add' whatever he wants into a directory. That's it.

Would anyone like to provide a web site with PERL capability, free of charge, so that I may try to start writing this program?

Email me... C 'yaz.

But we're looking at getting something going, not local but
provincial.
Contact James Alexander at OAU on Yahoo for more details.
I'm in Ottawa and recentlty acquired some 8-bit equipment and looking
at setting up a BBS also here in Kanata (Ottawa) myself.
Possibly some ST related stuff also, but a newbie to the 16 bit
myself....

No it doesn't. It doesn't have the same keyboard or function keys, different
joysticks, doesn't fit nicely in front of the telly, you can't quickly reset it
by opening and closing the cartridge port and Atari graphics become lego-vision
on an ultra-sharp PC monitor. Also the disk-drive doesn't make anything like
the proper noise, you can't double the capacity of your hard disk by cutting a
notch in the side and don't get me started on 'Conversational Spanish'!
```

How is the soft scroll implemented on the Atari? I'm vaguely familiar with all these code words like Antic, GTIA and that it is programmed with copper-like lists (similar to the much later Amiga, although Jay Miner designed both systems).

Maybe it takes less perfect timing to get smooth scrolling in any direction (double buffering?) on the Atari, and many of the C64 programmers never got hang on how to do it properly.

I for one still haven't made any totally jitter-free full screen scrollers on the 64, but I've tried both horizontal and vertical and knows in theory how to go ahead.

Hi,

> How is the soft scroll implemented on the Atari?

Easier to do than on a C64. On the Atari, you adjust the HSCROL register
of antic for small scrolling values, and just reset a pointer (or a couple
of pointers) in the display list. No need to move memory around. For the C64,
the VIC wasn't as flexible as Antic. IIRC, it does have a HSCROL register,
but when this wraps around, you really have to move all bytes in memory, and
that's what it makes slow.

> Maybe it takes less perfect timing to get smooth scrolling in any
> direction (double buffering?) on the Atari, and many of the C64
> programmers never got hang on how to do it properly.

Well, I rather suppose that it's hard to write a fully screen-synchronized
memory mover. It might take longer to move all bytes than you have for one
screen refresh. For the Atari, you just adjust some pointers and off you go.

So long,
Thomas

Well what version would you recommend? I used to run a BBS until '93 on version 3.x written by Stephen Carden and Keith. I still have all my hardware and could run on the 8bit. I don't think people would be interested in dialup so most likely it would need to be telnet.

Actually, myself and several others have been working on an Atari
Ethernet Cart. A version of Contiki that runs on this will follow.

I have a proto-board wired to one of my 130XEs (notice the
MyIDE interface there as well in the picture below...)

http://jybolac.virtualave.net/atari/images/atari_a8_ether.jpg
(messy, I know, but the connections are there.)

The layout for the cart is actually mostly complete, but I need
to take some time to do some debug. I would like to make a run
of about 60 or more ethernet carts for the 8bit, so if anyone is
interested, drop me a mail.

This project is in the pre-pre-just getting started stage, but I
want to let you know that there are software and hardware projects
going on. Preliminary prices would be about $10-$15 for the bare
board, about $25 for the board and some components, and $70-$80
including the ethernet RJ-45 board.

Hey, if the C64 can do it, why can't we?

Hello,

Is anybody familiar with the program? Here is a link:

http://pvb.free.fr//Atari/Atari_Index.htm
(click on "Atari Rom File Designer" at top of page")

It looks like interesting software, looks like another 1050-2-PC type
software, but I can't figure out what it has to do with ROMs. Just
curious, in the web pages the author appears to refer to disk image
formats as "roms". What gives?

Neal

Hi TXG-

> Secondly you need to modify the black-box to support the ZIP drive. After that you need to manually configure it in de controller list. <

What kind of ZIP are you using -- external? I have the (old) 100 MB Internal SCSI. It's been several years since I put this together, but I don't recall having to do any mods with the termination. What did you do with the BB? IIRC, the ZIP has a termination jumper and so did my HD (200 MB Conner). There is one "trick" that simplifies things -- make all the partitions the same size. Mine are all 60,000 DD sectors -- which works out to a little less than 16 MB. Some folks don't care for this since it hampers flexability, but to me the simplification is the better choice. Eventually, I'll get most everything except a few boot games backed up as ATR's on CD-Roms.
Larry

> really have to move all bytes in memory, and that's what it makes slow.

Yep. Double buffering might help a little, as you can prepare the "next"
screen in parallel with the other computing, and when the scroll register
wraps around, you shift to the other screen at a proper timing (when the
raster is off-screen preferrably).

I've understood a lot of the VIC-II tricks depend on the "bad" lines
and fooling with the raster counter, which surely was outside of the
intended use when the chip was designed.

> For the Atari, you just adjust some pointers and off you go.

I've understodo the Amstrad CPC6128+ has some quite advanced hardware
scrolling capabilities too, but I know too little about that architecture.
Maybe this would be a reasonable thread to crosspost a little...

What are those tricks -- horizontal/vertical interlace to "double"
the resolution in either direction? In that case, it has been done
on the C64 too, but as always interlace flickers too much to be
useful for a longer period of time.

Ice-T uses 320x192 1bpp graphics mode (aka "GRAPHICS 8" in Atari BASIC)
to provide 80 column text, but to scroll, it only needs to update a couple
of ANTIC pointers and clear one line's worth of text (40 x 8 bytes = 320 bytes),
rather than MOVE almost the entire screen (nearly 8 Kbytes). :^)

FlickerTerm80 uses 40x24 text mode (aka "GRAPHICS 0") and flips between two
character sets. One with the shapes on the left side of the characters, e.g.:

```
........
..#.....
.#.#....
.#.#....
.###....
.#.#....
.#.#....
........
```

and the other with them on the right. At the same time it swaps the fonts
(every frame), it also switches which chunk of memory is being displayed on
the screen.

So one 40x24 (nearly 1K) buffer contains text like this:

Teqikbonfx

And the other 1K buffer contains the other half:

h uc rw o

Combined with the font swapping, you get:

The quick brown fox

The flickering IS noticable, but really not too bad. And to scroll an
entire screenfull of date, you simply move less than 2K and clear 80 bytes
at the bottom. :^)

Again, versus moving nearly 8K of data, and wiping 320 bytes at the bottom,
as you would in a plain 320x192 graphics mode with _no_ "tricks", but only
raw muscle.

This ends up allowing higher modem speed support at 80 columns (e.g., 19.2Kbps), which the graphics-only mode would NEVER be able to keep up with. ;)

Add to this the use of sprite (player/missile) overlays, and you can do text highlighting, underlining, etc. :^)

Finally, in "FlickerTerm" modes, you can actually squeeze the characters closer together -- e.g., use all 4 pixels wide -- and they don't look nearly as bad as they would in a raw graphics mode.

e.g., this:

```
## ### #######
# ## ## # #
######## # # #
# ## ## # #
# #### #######
```

would actually look like "ABCD" rather than the mess above. ;^)

Oh, so you CAN swap / double-buffer. Just not do it so finely-grained as
one byte (character cell) at a time, as on the Atari?

The Display List in the Atari helped a ton with horizontal scrolling, too.
You can simply store the entire 'map' of the game in a 1000 x 20 chunk of
memory, and update 20 display list pointers (one per line) to scroll
around your 40x20 'window' of the map.

Hrm, I'm getting tired and rambling. Sorry ;)

bill@newbreedsoftware.com (William Kendrick) writes:

> Oh, so you CAN swap / double-buffer.

Sure. The chip can access 16K of RAM, and a character-based screen
only takes 1K of that, so you can easily fit two copies of the screen
into memory (plus sprites, graphics etc). But you have to do all
the buffering and swapping by hand.

If you're working in hires mode (which takes 8K memory), it is probably
impossible to smoothly scroll this screen as moving 8K of memory back
and forth (plus making changes to the graphics!) would take a little
too much time, unless your scroll is _really_ slow.

So what you do in reality is that you copy the character-based screen
row by row into another buffer, with the exception of offseting the
source or destination by one cell in either direction, plus inserting
the new graphics at the end. When the HSCROL register has wrapped,
you hopefully have completed your copy and point to the new screen.
Then you reverse the process.

The VIC buffer can be placed at various "fixed" positions in memory, though
not at arbitrary positions, unlike ANTIC. I'm really not an expert in the
C64 hardware architecture, so others might know better, but the thing was
that VIC more or less provided only a couple of address lines and the
remaining addresses for addressing the display had to come from somewhere
else, IIRC from the CIAs.

> The Display List in the Atari helped a ton with horizontal scrolling, too.

Exactly. BoulderDash is one of the examples that come to my mind.

Thomas Richter <thor@cleopatra.math.tu-berlin.de> writes:

> The VIC buffer can be placed at various "fixed" positions in memory,

At least every 512th (maybe 256th?) byte within the 16K bank, which
also can be changed to make VIC read from another section of memory.

This could also be useful for "virtual consoles" outside of the
scrolling features. Would it be difficult to implement virtual
consoles on the Atari? Maybe that could be done with the scrolling
as well, as you were able to define oversized screens and would only
"scroll" one screen width at a time.

I've been thinking a little about which 8-bit computer is most powerful
for writing small games (like the 1K, 2K, 4K minigames). The 6502 is a
little cumbersome with its few registers and lots of swapping into
memory and stack, but I have too little experience of other processors
like the Z80, 6809, 1802, 8080, 9900 (ok, 16-bit) etc to make a good
comparison.

When it comes to graphics chip, ANTIC seems to be the most flexible
one? VIC-II and the TMS chip found in e.g. MSX machines might be good
runners-up when it comes to good performance with low overhead. Sound
is not too important in a 1K game, so I judge all chips equally. Other
issues like memory layout, DOS/run-time overhead might be interesting.

So, maybe a 6809-based machine with ANTIC, SID, a well considered
memory map and a rich ROM to call would be a dream machine for 1K.

Message-ID: <3568e886.0309110112.3be28ab2@posting.google.com>
Source record: 19293

Hi,

I have auctions running for a number of Atari 8-bit items, including SCART cables, and quite a bit of software. Please note that I am offering some cheaper shipping options for the PPP software which I have listed previously, so if you were interested before but were unwilling to pay the shipping, have another look!

I also have some Deluxe versions of my combined SCART/RCA cables available again. These plug into the Atari's monitor socket and connect to either your TV's SCART socket (if it has one) or the RCA Phono sockets. This means it will work in any country (except SECAM countries). These deluxe versions have high grade double-screened cable and gold plated plugs. Much better than using the TV output cable!

The link for my auctions is:

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

Also, don't forget to visit my website for articles, downloads, and on-line Atari shopping: http://www.dgs.clara.net

No, not at all. Just keep separate display lists and separate video
buffers and just write "into the right one". About the only problem that
comes to my mind is the limited memory the Ataris have to provide (or
rather, "fail to provide").

> I've been thinking a little about which 8-bit computer is most powerful

The Z80 is more powerful, has more registers and quite some powerful
instructions, but it requires more cycles per instruction than the
6502 does. The 6800 family is not that much different from the 6502
(after all, the 6502 was constructed by a couple of engineers that
run away from Motorola...), it just provides two 16 bit index registers
instead of two 8 bit indexes, and has therefore some variations of the
6502 addressing modes. The 8080 can be compared to the Z80 in various
aspects, lacks a couple of features. The others I don't know.

> When it comes to graphics chip, ANTIC seems to be the most flexible

ANTIC is not really a graphic chip. It is more like a DMA co-processor,
it doesn't generate the display itself. That's the matter of the GTIA.
Antic pushes video(bitplane) data into GTIA which then generates the
display. The major problem of GTIA is the lack of color registers, and
the rather poor "sprite"/"player missile" capabilities. It has nine
color registers (each 128 colors each, though), but without additional
trickery, only at most four of them can be used for playfield generation.
The VIC provided the additional color RAM and could define two separate
colors for each 8x8 block. This doesn't fit at all into the "antic" way
of thinking, of course. It would be cool if there would be one additional
DMA channel that would allow re-loading the GTIA color registers on
the fly (like the Copper on the Amiga) without requiring the CPU for that.

> Sound
> is not too important in a 1K game, so I judge all chips equally.

SID is more advanced than POKEY, but lacks one channel that could
be useful. A dual-SID setup would perform very well (and stereo).

> Other
> issues like memory layout, DOS/run-time overhead might be interesting.

> So, maybe a 6809-based machine with ANTIC, SID, a well considered

Well, I would vote for two SIDs and possibly a modified ANTIC/GTIA, but
then that's all dreaming...

So long,
Thomas

# 5134. MS BASIC II Disk & Docs

Apart from the 16-bit index registers, I've read that it supports
double accumulators which may come very handy.

The 1802 is an odd beast from the early 70'ties which has a reduced
set of instructions but a lot of registers. It was used in various
applications like the DIY computer Cosmac Elf, the Pong-like console
RCA Studio II, a very R@RE computer called Comx 35 and in the Voyager
space probes. Some day I'll have a go at writing some Studio II game.

> ANTIC is not really a graphic chip. It is more like a DMA co-processor,

Ok. How about the combo of these two then?

> The VIC provided the additional color RAM and could define two
> separate colors for each 8x8 block.

Yep, but in that mode you only *have* two colours per 8x8 block,
despite being able to choose these two independently.

> SID is more advanced than POKEY, but lacks one channel that could
> be useful. A dual-SID setup would perform very well (and stereo).

Well, three or four channels shouldn't make all the difference. You
can also play raster tricks with SID and overlay digis (samples) on
top of the SID generated sounds. There are a couple of songs in the
HVSC which features 3 SID channels plus 2 digi channels, and it sounds
quite OK.

(I've also composed music for the VIC-20, which has a four-channel
sound chip where the first three channels overlap eachother by one
octave and provide really terrible frequency resolution. While it
is nice to have four channels to work with, I'm sure I could've
sacrificed one channel for better sound)

> Well, I would vote for two SIDs and possibly a modified ANTIC/GTIA,
> but then that's all dreaming...

Given 1K of RAM, I really prefer the meaty ROM with easy accessed
routines for arbitrary multiplication, hex->dec conversion, print
to screen, set up graphics etc. On the other hand, a such machine
with the cream of the best hardware and software probably would
have much more memory and interfaces than a stripped-down 1K box.

# 5139. Re: Any ATARI shows (somewhere in the world) ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-11 16:55:13 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F60A8F1.E6C94BA1@students.uni-mainz.de>
Source record: 19302

Well,
of course there are. here in Germany there are at least 3-4 parties, like 1) Schreiersgruen meeting (A8 only meeting, usually in Spring, every year), 2) Unconventional Lengenfeld (Atari 8-64 bit and Acorn meeting; usually in the last week of august or the first week of september, every year), 3) ABBUC JHV in Herten (ABBUC meeting and show, A8 only, always at the end of ocober, every year) and 4) 8Bit Boerse in Frankfurt/Main (normally twice, in spring and late fall; this year only one meeting together with the eurocon in karlsruhe; www.eurocon.de or so);

Besides the german atari meetings there are also lots of demo and scene meetings in Poland, Slovakia and Czech Republic. Just visit the polish homepage www.atariarea.histeria.pl (polish language!) to read the latest news and download the latest A8 software... Afaik, there are also many Jaguar-shows (Jagfest) in the USA, UK and Australia (and elsewhere). Last not least there is the Atari World in Las Vegas every year... greetings, Andreas Magenheimer.

P.S.: Most of these demo and scene meetings are only small fairs, with only 20 - 100 users. Not every meeting or fair features new A8 software, many meetings are just game, demo buy/sell and/or discussion meetings...

# 5140. Re: The music program MASIC ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-11 17:00:49 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F60AA41.60E47CEF@students.uni-mainz.de>
Source record: 19303

Well,
Masic was developed here in Germany around 1988 or 1989. Later many more
Music editors and trackers arrived, like Benjy soundmonitor,
Soundmonitor Professional, Black Magic Composer, Pegasus Soundmonitor
and many others. So Masic was not used any longer. Nowadays, even most
of the newer german music editors are not used any longer, because of
the much better polish music editors (e.g. chaos music composer,
Multi-Pro-tracker, Theta-Music-Composer, etc. etc.)...

Well, I have some sources in masic, as well as 9 demo disks with Masic
sounds (where 8 disks were done by one and the same author). if you are
interested in these (or in any polish demo music disks), just write me
an e-mail... greetings, andreas.

Zothen Runecaster schrieb:

# 5141. Re: Could an 8 Bit system do "Populous" ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-11 17:08:00 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F60ABF0.C7CC0DC7@students.uni-mainz.de>
Source record: 19304
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm

Hmmm,
afaik there are already some 8Bit atari games with 3d graphics. I do remember the following games: Q-Bert (and many clones), Pogo-Joe, QB, Xagon, Amaurote, Chimera, Mad Marbles or Marble Madness (a PD clone of Marble Madness), Spindizzy and a few more games with pseudo-3D graphics. The problem could be the many people running around the screen, therefore one would have to use software players (like in DROL and other games) instead of hardware players (where only 4-5 are available) or some other tricks to create more than the standard players (like in Mirax force, 16 Players demo, etc.)...

Most of all, one would need a good + motivated programmer, who does not give up programming after a certain time or a certain problem. We already have many good, but unfinished A8 games, because of lack of motivation or time... greetings, andreas.

Source record: 19305

Well,
if you are a member of ABBUC, then www.abbuc.de is the best source.
Members can download not only every ABBUC magazine, but also the whole
ABBUC PD library as well as thousands of source-codes in Assembler,
Action, forth, C, etc. etc. They also have a big library of books and
magazines for download available...

Otherwise you have to search around the net to find quite a lot of sites
for demos (Sven gleich`s demo page for example), games (homesoft`s side
for example), demos and applications (atari-area for example) and many
other things. Greetings, Andreas.

Hmmm well,
that depends on what you mean with "new"... Last year (afaik) we had the great Numen demo by Taquart, featuring many never seen effects. This year we had the Too Hard 4 demo by The animkomials. Looks like nowadays only one demo per year is getting released. but maybe you do not know the newer A8 demos of the 90`s from Poland, Czech Republic, Slovakia and Germany ?!? Well, what about:

The asskicker demo (Shadows), The X-Demo (MadTeam), Tit-Demo (MadTeam), JHV 2002 demo (by JAC!), Trip 6 demo (by Shadows), Nonjm-Demo (by tight), total Daze demo (by tight), Journey demo (4-bootdisks version by Polynomials, packed 170k file version by Madman/MadTeam), Worms intro (by datri), The Bill Pie demo (probably by MadTeam), The Ergo Bibamus demo (by Quasimodos), Vengeance demo (by Excellent), Sheol demo, Timekeeper demo, Khai-Et demo, Base 33 demo, Starwars demo, wormhole demo, etc. etc. - most of these are available at: www.atariarea.histeria.pl or from me, if you write me an e-mail.
greetings, andreas.

From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F60B141.DB8925BB@students.uni-mainz.de>
Source record: 19307

Hello,
a long long time ago (somewhere in the 90`s) a well known friend of mine
(Thimo Graef, who also uses the Pseudonym Dungeonmaster) started a
Dungeonmaster project in turbo-Basic XL. Therefore he converted many
graphics from Dungeonmaster and Bard`s Tale into the 256 color format
(gr. 9+11). The game required 128k RAM (because of the used
digi-samples) and featured a small labyrinth with certain monsters you
had to fight and some waepons and money you could find. There were also
hidden and invisible walls - but alas, the game was never finished and
had a couple of bugs. If you are interested in the source (2 disksides
with many pics, sounds and Turbo basic listings), I can send you a copy
of it. But, if I remember correctly the game was programmed in german
language, meaning it prints german sentences on the screen... anyway,
e-mail me, if you are interested... greetings, Andreas Magenheimer.

We're dealing with domain name transfer issues. I've been working on it all day, and expect the sites to be available again in a day or two. Or more, depending on the mood of the DNS gods. In the mean time, you can access the Australian mirrors at

http://atariarchives.planetmirror.com
and

Does anyone have a 1050 2 PC cable for sell or know of somebody who sells them reasonably? Thanks!

## 5150. Infocom game images

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-11 22:04:41 UTC
From: Mark Keates <news@mkeates.force9.co.uk.removeme>
Message-ID: <Yp68b.853$0x5.148308@stones.force9.net>
Source record: 19313

Hi,

I've been checking the atr/dcm images available via XlSearch and have found
that
a good proportion of the games are corrupted, bad bytes/missing sectors etc.

Checksums are OK for:

HOLLYWOOD HIJINX
INFIDEL
LEATHER GODDESSES OF PHOBOS
PLUNDERED HEARTS
STATIONFALL
SPELLBREAKER
SUSPECT
SUSPENDED
WISHBRINGER
ZORK I
ZORK III
ZORK II
ENCHANTER
CUTTHROATS
SEASTALKER
BALLYHOO

But:

THE HITCHHIKER'S GUIDE TO THE GALAXY
Checksum bad! actual checksum = 1ac4, required checksum = 2235
THE LURKING HORROR
Checksum bad! actual checksum = fbda, required checksum = fb9c
THE WITNESS
Checksum bad! actual checksum = ea1d, required checksum = 1334
PLANETFALL
Checksum bad! actual checksum = d343, required checksum = 13f4
DEADLINE
Checksum bad! actual checksum = 5447, required checksum = 548d
Moonmist
Checksum bad! actual checksum = f3cb, required checksum = b5af
STARCROSS
Checksum bad! actual checksum = 5e30, required checksum = 5e70
SORCERER
Checksum bad! actual checksum = e7d6, required checksum = e7ac

For example: Sector 36 of Witness disk 2 is missing.

Can people supply me other images of the above games for checking.

Many thanks,

Mark

CyberStella (StellaX-1.1.3a)

is the latest so far if you want to play 2600 games, along with interesting fact in the list (rarity, company names, etc.

I think CyberStella needs to run WinXP - not sure.

You can even play 5200 and 7800 games in emulators for PC now. Atariage.com is an excellent site to download ROMs.

Atari Lynx? Yes, Handy .90, with real-looking Lynx on screen.

Atari Jaguar? Hard to find - but emulator is Tempest or Jagulator :o)

Hi there is a guy out of Poland selling these on Ebay.com the one I got is pretty good for the money. Also the developer and programmer of A.P.E has them forsale. Also Nick Kennedy use to make and sell these. I even made one myself after buying one to use. They are easy to make very little soldering and really speed deamons with the Happy upgrade 1050. I can burn any disk in just seconds. A.P.E Prosys even does some workarounds for copy protections..

(I think a saw a Roy G Biv billboard in Columbus,
it is an artistic company of some kind.) Also a Google
on RGB there is a control software company by that
name. Since this is about the Columbus Swap meet,
I would guess Dave is a fan of the art stuff.

I'm Going! Any requests for me to bring something
someone might buy or trade? Can't think of anything
off hand. Don't plan on renting a table.

# 5164. Re: Atari++ Windows is GREAT!

Hi,

> Atari++ for Windows? Never heard of it - where can I try this emulator for PC
> (winxP)?

Here:

http://www.math.tu-berlin.de/~thor/atari++/

> Most importantly, you mentioned:

> "I used a real joystick". Do you mean "CX-40 Atari" classic joystick?

Yes, though I prefer my "Competition Pro" joystick. Better handling. (-;

> If so, how is that possible? My PC only uses serial, USB ports. I dont know
> how to make one.

You need to build a tiny interface ("El Cheapo Joystick interface"). It
consists of two sub-D connectors and three resistors, all in all worth
only a few cents. This allows you to connect an Atari joystick to a
standard gameport of a PC. It won't accept USB ports, though.

> Can I buy it from you or can I hired you to build one for me?

Hmm. Currently, I haven't tried to setup a series of these interfaces.
Maybe I should?

So long,
Thomas

ftp.spudster.org is a good place to look. They definitely have Lurking
Horror among their Infocom games.

The server's a bit (okay, very) slow, but still worth checking out for
all sorts of 8/16-bit goodies.

That's where I was getting the images from :-/
Basically they are clones of the CTH archive images
with errors 'n all. Moonmist for example errors
on the first thing you type.

Regards,

Mark

> something?

> Infocom games were re-released in multiple versions.

The z-code header block contains the following (offsets in hex):

12-17 2+ serial code (ASCII, usually a date YYMMDD)
1A-1B 3+ file length (divided by 2 (V1-3), 4 (V4-5), or 8 (V6-8))
1C-1D 3+ file checksum

The verification code exists in the interpreter but
isn't always called as it has to scan through all data.
In WinFrotz you can type verify and the checksum is done.
IIRC its just a running sum of the data bytes.

The tool zcut can be used to get z-code from disk images
and ztools contains a few programs for getting info out
of a z-code file.

Regards,

Mark

Does anyone know who wrote the very first Snake/Nibbles game?
There have been so many clones, trying to find the original
version is almost impossible!

Many thanks,
Paul.

Yes, I agree with you Chris. We should be able to hook our Atari
8-bits up to an Ethernet. I would love on of these carts for my
130XE. Looks good so far...

# 5177. Registry Files Intwined in .atr files

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-13 05:08:10 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <f9d1bce41a797121703fbb2e819fba36@news.teranews.com>
Source record: 19339

Anyone know anything about this? I do not see how an .atr image file can fiddle with the registry.

===

Hi, I just wanted to touch base with you on the Holmes CDs. When the site was still up I collected quite a few goodies from there and found something alarming. Someone's 98 registry files are all intertwined inside the .atr files. I have no idea if this is pre-zip corruption or worse post-zip corruption but the fact remains that I should not be able to read Windows registry entries within an Atari atr file. Use a hex editor on those atrs you intend to offer for sale, please?
I emailed Holmes about it but never got a reply, several users privately too - nobody seems to care. I'd be very interested in the collection if only I got some answers to the corruption thing. The last thing I need is a couple gigs of corrupted atrs.... I did not go public with my concerns out of respect for Holmes' obvious compassion for the Atari platform - I will show you the same respect. Perhaps someone has copies of those files before they got corrupted? Thanks for your attention. Best of luck in this endeavor.

"Steve S" <j70141@hotmail.com>:

It appears that Mr. Anonymous is complaining that the ATR files are corrupted with some "registry-like" text. I wonder if it is something on his own system that corrupted the files? Most of the stuff I've downloaded from Holmes website was fine.

The atr files themselves won't do anything to the registry, or anything on the computer, but who knows what a buggy emulator, other buggy software/hardware might do?

These images were probably created with SIO2PC. If you make a new disk
image in SIO2PC, write the image to disk and then exit, you will see the image
is not blank but contains the contents of the memory allocated by SIO2PC.

Steve

Yes, several companies asked me to remove their files, crystalware was one
of them.

Most contacts were from the legal owners of games saying it was cool to have
them online.

Cheers
Aaron

PS- Seems that mirror is still trying to link to my old webspace, which
means it's pointless having the mirror, as the files arent downloadable.

Message-ID: <Pine.GSO.4.56.0309141505400.7993@shell1>
Source record: 19207

On Fri, 12 Sep 2003 at 13:30:55 -0400, Russ Gilbert scribbled:
->(Does red, orange, yellow, green..... ring any bells?) ... Ok, so
->Roy G Biv doesn't come from the art place. I still don't know why
->you use it as a handle.

I'm not sure whether this is a handle question or a color spectrum question. There's no significance to it as a handle. Besides, it isn't a real handle; it's only a header line in which I've used the rather ancient device of planting fake info in order to deter spammers from harvesting my real address.

That method hasn't been state-of-the-art on the Usenet since about 40 years ago, but I'm still doing it on the logic that there's no point making it easy for the spammers! For the header lines in this posting I've lazily left the fake info in place that's left over from a posting on another newsgroup. No big deal, eh?!

As for the color spectrum, Isaac Newton is credited with discovering it. "Roy G Biv" is just a shorthand way of remembering it: Red, Orange, Yellow, Green, Blue, Indigo, Violet. (Modern science says there's no separate indigo color.)

BTW, how was the Atari show in Columbus? I missed it.

hi greetings to old atari users
i am wilfried (physics)
had much fun with atari 400 + 800 and wrote several small basic programs
DO YOU KNOW AN EMULATOR FOR PC TO GIVE THE SAME FEELING?
I am not interessted to define scrolbars .....u know
with kind regards wilfried (50, 2 kids)

# 5185. Pre-ordering available now: 8MBit Flash Multi-Cart for Atari 8-bit Computers

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-14 21:43:09 UTC
From: Steven J Tucker <classics@atarimax.com>
Message-ID: <Nh59b.337$Gh7.392286@news2.news.adelphia.net>
Source record: 19346

Pre-ordering starts today for my 8Mbit Flash Multi-Cart/Disk-Cart/Homebrewing Cartridge, with shipment of all orders by 09/22.

The cartridge is professionally produced, with open-source software and extensive documentation.

Limited edition pricing is $39.99 per cartridge, with a shipping discount for buying five. After 9/22 the price will increase to $44.99.

For complete product information and the order form go to:

http://www.atarimax.com/

or directly to the MaxFlash cartridge page at:

http://www.atarimax.com/flashcart/documentation/

Highlights:

-> TRUE 8Mbit ( 1M Byte X 8 ) Flash design.
-> Entire 8Mbit flash space reprogrammable in-system.
-> Hobbyist oriented design, no surface mounted parts, reasonable price.
-> Highest quality color labels.
-> Easily create and share your cartridge projects with anyone.
-> Supported by the same open-source perl/6502 development kit as the 1Mbit cartridge.

# 5188. Resurrected old game: Atari Avalanche

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-14 23:01:42 UTC
From: phozz bare <phozz@nowhere.com>
Message-ID: <newscache$k558lh$i77$1@lnews.actcom.co.il>
Source record: 19199

I've found a game lying around on one of my disks in a non-standard format, with a BASIC program that was being used to load it. The game is called Avalanche (*NOT* the Qbert clone from ANALOG computing!).

It's similar to Kaboom! in that you have to move a paddle and catch falling rocks. This is not a game that holds the player for more than 5 minutes, but I guess it's worth keeping for the historic records - I have seen no mention of this game elsewhere.

I've converted the file to standard binary format. If anyone is capable of (a) extracting the .exe file from my .atr, and (b) post it on one of the game websites, please email me (itayc at hotmail).

Also if anyone wants a copy of this old disk and wants a shot at saving anything else on it (there are some standards like Missile Command, but some weird titles like Fastgammon and Micro Chess that I haven't been able to run - but I do recall seeing them work in the distant past), please email me as well.

-itay

## 5189. Under-length ATR files?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-15 00:01:33 UTC
From: Kevin Savetz <usenet-DELETEthisPART@savetz-DELETEthisPART.com>
Message-ID: <usenet-DELETEthisPART-8866DE.17013314092003@news.west.cox.net>
Source record: 19200

Someone e-mailed me some APX games in ATR format to add to the Atari Program Exchange archive, but they're less than the usual 92176 bytes. They seem to work with my emulator but I thought the ATR standard said they're supposed to be that exact length. Can someone fill me in: are these files reliable for general use? Is there a way to convert them to 92176-byte files?

Thanks
Kevin

>them. One on the 8-bit would be super. Keep us informed....

I played the first Dungeon Master on the Amiga. It was Amiga World's
Game of the Year in 1989. It was just incredible in the play value and
the integration of sound. There were other, later 3D Dungeon games
that had better graphics (like Eye of the Beholder) but they never
matched the play value.

Hey, I just thought of an easy way to play DM on the Atari 8bit. Just
port Java, then you can play the Java version! ;)

Kevin,

The ATR header actually specifies the length of the file in
16-byte segments. It should be technically correct as long as it
ends on a 16-byte boundry and the number of paragraphs in the header
is accurate.

I think what that is, is that they was a tool that converted EXE files to
ATRs, so they are small, but work like a ATR in the Emulator. You will
need to extract the EXE from the ATR and recreate a real ATR and that will
work. I use a tool called ATR Utility.

I use the old CX-40s but I had to make an interface. I used a keyboard
encoder
called an IPAC ( www.ultimarc.com ) and just mapped the keys in the emulator
to the joystick movements.
I have not tried Atari++, but I have played many games using it w/
Atari800WinPlus.
I'll have to try out Atari++ soon.

There's no need for an ATR file to be exactly 92176 bytes in length. The ATR encodes itself in its headers how many sectors it contains, and if the image itself never refers to a sector beyond the ones indicated in this header, everything is fine with it.

So long,
Thomas

(Now RGB is Dr. Fossil. It's Dave. How was swap
meet in Columbus.)
Me and my friend got there about 1:30 PM and I guess
several vendors had already left. It was smaller this
year, with less stuff than people had in the past when
I went. I paid my admission and stayed only 20 minutes
or so. I guess I could have socialized more. I saw
Wayne Arens, who is an officer of CACE, and I didn't
get the name of the guy who took my money. I met
Nick DiMasi, the president of SCAT, the Suburban
Chicago ATarians.

Even after you explained red, orange, yellow, I still
didn't get it until you spelled it out for me.

There are some pictures of previous CACE swap
meet at:
http://www.angelfire.com/oh4/acec/acec.html

If I'm not in error. The link at:
www.atariguide.com

Shouldnt matter. If you tend to take your drive apart a lot then
stranded will last longer, being more flexible.

> "I used a real joystick". Do you mean "CX-40 Atari" classic joystick?
>
> If so, how is that possible?

Here is a copy of my Goggle posting on Dec 27, on the same subject:

The way I did it can be found at this web site:
<http://random64.emuhq.com/doc1/Joy2600-PC_eng.shtml>. It uses a game
controller to interface your joystick to and requires no parts other
than a switch if you want to use it for both a real Atari computer and
a PC. I did not include the switch in the circuit because I do not
plan to use the joystick for a real Atari computer, just for the pc.
There is also information here for interfacing paddle controllers to
the game port, but I haven't tried that yet. Another method can be
found at the following web site:
<http://www.epanorama.net/documents/joystick/pc_circuits.html#atari_pc_converter>
it requires more parts and building a circuit board.

> sure someone predated that...

I don't know, but I suspect that Snake originated from a non-microcomputer. Unfortunately, I cannot find anything to support this. An example of such a machine might be a PDP based system (PDP-1 for example dates back to 1961), an even larger system (when compared to the PDP-1) was the TX-0, some of the programs written for that have been written many times for PC based computers like the Bouncy Ball & Tic-Tac-Toe.

Cheers,
Ross.

## 5213. -=[ WANTED: Old/Used Computer and Electronics Magazines ]=-

Newsgroup: comp.sys.atari.8bit

WANTED:

Old and used computer and electronics magazines, periodicals, journals, conference proceedings, etc. for a historic computing archive. Age is of no relevance.

Atari related magazines and newsletters are desired.

Specifically looking for the following titles currently, though this is by no means a definitive list. We are interested in ANY and ALL old or used computer or electronics magazines.

Business Computer Systems
Business Computing
Classroom Computer Learning
Communication News
Computer Decisions
Computer Design
Computer Graphics World
Computer Merchandising
Computer Reseller News
Computer Retailing
Computer Shopper
Computer Systems News
Computer Update
Computer Weekly
Computer-Aided Engineering
Computerworld
Data Communications
Datamation
DEC Professional
DEC User
Digital Technical Journal
EE Times
Electronic Engineering Times
Electronic Design
Electronic News
Electronic System Design Magazine
Federal Computer Week
Hardcopy
Hewlett-Packard Journal
Infosystems
InfoWorld
LIST
Micro Marketworld

Micro Report
Mini-Micro Systems
MIS Week
Network World
Office Administration and Automation
Office Computing Report
PC Magazine
PC Products
PC User
PC Week
Personal Workstation

There's a Noughts and Crosses (ie Tic Tac Toe) program sitting here on
my EDSAC simulator, and the date on that is "c. 1952". I'm not sure
that machine would have lent itself terribly well to arcade games,
however... ;-)

Really? I've got an EDSAC emulator (probably the same one as you do) & even that has shown to be capable of doing a bouncy ball (which they call a Pong Demo!). I haven't played the Noughts & Crosses on it.

I've also asked others (elsewhere I think) about the possibilities of using the phone dial as some sort of controller (which it would), but it wouldn't be practical on the actural machine! ;-)

Cheers,
Ross.

Excuse my ignorance (I'm too young), but when did the first CRTs
or similar displays/terminals appear with computer equipment? I
have a vague memory about learning it once, but it has slipped
my mind. I guess a terminal which you can constantly update is
preferred when you play a Snake game. OTOH, Ross mentioned a
Pong demo, which I assume also includes some display updating?

(try to imagine 50 years from now, whether people will refer to
XBOX in a similar nostalgic tone as you just mentioned EDSAC :-)

Yes EDSAC has a display (so did ENIAC which came out before that I believe),
but it's quite unusal. It's round, was supposed to be small & the resolution
of the screen was built up of dots (which means there was no character set).
A daisy wheel printer was also used. In case I'm wrong about any of this,
alt.folklore.computers will know! ;-)

> (try to imagine 50 years from now, whether people will refer to
> XBOX in a similar nostalgic tone as you just mentioned EDSAC :-)

Well maybe, but the thing to remember is that 50 years ago there were fewer
machines than what there is today, which means the machines that did exist
stood out more. If you check out http://www.old-computers.com/museum &
machines which were made 30-40 years ago, you'll see it becomes trickier to
remember those! ;-)

Cheers,
Ross.

Ah, high-resolution graphics from the very beginning! The issue with
"no character set" is of course present on much more recent systems
too; not even NES has a default font in ROM...

'Um no, not exactly. The screen goes like this 34 dots across & 16 dots down! ;-)

When the PDP-1 can out in 1961 high resolution graphics were out (even though it was in mono). However it still different from when high resolution mono graphics came out for the Microcomputers.

> The issue with "no character set" is of course present
> on much more recent systems too; not even NES has a

Yes, well NES aims itself purely on graphics. EDSAC is pretty simple in comparasion to anything. You might as well say that it's 34x16 pixels! But still it doesn't stop having the usual bouncy ball routine running on it! ;-)

Cheers,
Ross.

Somehow, high resolution is probably
********************************** a definition of its time. In 1982,
################################## we liked to call 320x200 hires, but
********************************** four years later, 640x400 was what
********************************** you would look for. What is a high
********************************** resolution display of today by the
********************************** way? Should 1024x768 be worthy to
********************************** call hires, or does one expect more?
**################################
################################## 34x16 is not too bad considering we
********************************** are speaking early 50'ties. However,
################################## it makes me wonder in comparison how
#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#* a TV picture with its rather good
#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#* resolution (even back then?) is
#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#* composed.. no, I would prefer not to
#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#*#* wander further off*topic into that
********************************** area.

Oh well if you put it that way, then yes people would have been impressed with it's resolution in it's heyday. It's a bit tricky putting a perspective on resolution when it can so easily compared to others (even in a 10-15 years period when EDSAC was overpowered by something smaller & had an higher resolution!).

You cannot compare Microcomputers with these earlier machines (as their's nothing to compare because they developed at different stages). Graphics was a luxury for a Microcomputer in the '70s (& Colour too!). A Vic-20 came with graphics once extra hardware was added! My first computer was an Amstrad which came out in 1984 it had 3 video modes (640x200x2, 320x200x4 or 160x200x16). When compared to a PDP-1 which came out 20 years earlier that's nothing, the PDP-1 had a very high resolution for it's time, but then there are a number of other factors which mean't writing something on a PDP-1 to take the maximum resolution was a bit more tricker!

In a sense, back then I don't really believe computers didn't have High Resolutions or Low Resolutions, because they only had one Video Resolution. High Resolution is more of a term used for a machine which provides a multiple number of video modes (which only really applies for newer machines).

It doesn't matter what period you're taking about in terms of video resolutions because we'll just be comparning the highest detailed thing against everything else. But for a computer which provides multiple video modes, then the highest resolution would be the one which provides the most detail, the lowest would be the one with the least resolution! ;-)

Cheers,
Ross.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Err.. are you trying to say it took until the development of the VIC-I chip before one of the first computers with both graphics, colours and sound was possible to produce for the mass market?

Oh well, as a disclaimer for getting off-topic, I might mention Tron, the first movie to be based upon a computer game (Snake clone, isn't it?)

I think the earliest displays were on oscilloscopes driven by D-A
convertors.

Your last comment is unreasonable as EDSAC is probably more modern
technology than the XBox.

## 5230. "New" Atari Infocom Adventures?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-17 14:14:05 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030917101405.14331.00001665@mb-m18.aol.com>
Source record: 19243

A recent post mentioned (apparently) corrupt Infocom ATR's. Based on using the Z-machine interpreter(s), would it possible/practical to "create" an Atari version of an Infocom adventure from another platform? It's mostly academic curiousity on my part, but since many Infocom adventures were not released for the Atari, it raises the possibility of "new" adventures for A8's. (?)

Message-ID: <20030917180002.a7459@du3.maus.de>
Source record: 19246

Hi,

I recently installed a ct60 in my computer. Then I downloaded the latest version of ATARI800 (an atari emulator) for my falcon.

Now I am looking for a benchmark program because I feel that without sound emulation speed might be 100%.

I found draco's sysinfo 1.9 on the net but I am sure there are later versions.

Does one of you know where I can download the latest version of Draco's program, I would prefer it in .atr format?

Regards,

Frank

> the Atari, it raises the possibility of "new" adventures for A8's. (?)

Hi,

Infocom had different 'levels' of Z-Machine interpreters.

v1 & v2 were always obsolete from our point of view.

v3: Ballyhoo, Cutthroats, Deadline, Enchanter, Hitchhiker's, Hollywood
Hijinx, Infidel, Leather Goddesses, Lurking Horror, Moonmist,
Planetfall, Plundered Hearts, Seastalker, Sorcerer, Spellbreaker,
Starcross, Stationfall, Suspect, Suspended, Wishbringer, Witness, Zork
I, Zork II, Zork III

v4: A Mind Forever Voyaging, Bureaucracy, Nord and Bert, Trinity

v5: Beyond Zork, Borderzone, Sherlock

v6: Arthur, Journey, Shogun, Zork Zero

For 8bit Atari we have all v3 games.

C64/C128 had also interepreters for v4 & v5, so:
A Mind Forever Voyaging (C128 only)
Beyond Zork (C128 only)
Borderzone (C64)
Bureaucracy (C128 only)
Nord and Bert (C64)
Sherlock (C64)
Trinity (C128 only)

So, if somebody has a looooooooooooooots of free time, he can port v4 &
v5 interpreters from C64 and then release these 7 games.

Edsacs crts displayed the data circulating around the mercury delay tanks
that served as registers and memory. The main one could be switched to
show the contents any of the 32 "Long Tanks" that constitued the main memory.
Each Long Tank stored 32 18-bit words. By writing data to a tank characters
or graphics could be displayed.

>A daisy wheel printer was also used. In case I'm wrong about any of this,

Run your own EDSAC - there are several simulators available.
All my info came from the manual for the simulator from Dept of Computer
Science, University of Warwick. Programming it is fun...I think... :-)

Oh no.

I guess I was stating the obvious when I was stating that Microcomputers, Mainframe & Mini based computers all developed at different stages. The PDP-1 (a Mini based computer) offered detailed graphics (for it's time). The PET computers is an interesting one to compare with a VIC-20. Both are Microcomputers, however one offered 512x512 screen resolution! :-) (in that instance it's what it's designed to do - the disadvace would have been at what cost?).

The VIC-20 is just a nice little home computer, so graphics wouldn't have been a high priority for someone back then. I guess if people insisted then the 176x158 would have come into play!

Well there's really a number of factors (as I pointed out) as to why computers were like that.

> Oh well, as a disclaimer for getting off-topic,

> atari++ or atari800win. it starts then stops, tho the sound still goes. does
> anyone have this gane? maybe I have a bad atr of my disk.

Not too unlikely. One thing you can try is to use a different machine/os
type (i.e. revert to an 800 emulation with an original Os A revision).

In case nothing helps, please sent the files over, possibly with an
explanation of how to reproduce the problem, I'll then see whether the
archive is broken or the emulator.

Anyhow, I'm working on a new release that attempts to fix some known bad
image files (mostly bad .EXE or .COMs).

So long,
Thomas

The *first* video game...Spacewar!...was written for a DEC PDP-1
a little after the 1960 time frame. It used a CRT to display the
game field and space ships.
>
> (try to imagine 50 years from now, whether people will refer to

I hardly think that XBOX will get "similar nostalgic tones" like
the EDSAC. There was only *one* copy of the EDSAC made. It took up
a room, had lots of vacuum tubes and mercury delay lines, and
was *not* convenient to access.

Just the dots.
You could, by careful choice of bit patterns, display anything that would fit
into a 36 column x 16 row array of dots. The Tic-tac-toe program (Oxo) shows
the moves that way, and someone wrote a space invaders simulation recently,
with sound effects courtesy of the Creed c/r sound :-)

There are open source Z-Machine interpreters available, such as:

http://www.geocities.com/SiliconValley/Heights/3222/frotz.html
http://www.plover.net/~thumper/nitfol/
http://jzip.sourceforge.net/

Try a Web search, and more will turn up. I don't know offhand if any have already been ported to the 8-bit Atari, or how much work it would take to do so. That would almost certainly be a simpler approach than trying to reverse engineer and convert a binary C64 interpreter, though. I think the big question would be whether the result of compiling C source code that was probably written for much more powerful computers would produce fast enough results, with enough free space for the games, to actually work with the games, especially the v4 and v5 games.

Thanks! :)

Hrm. I'm confused, though... is there a way to /download/ them from this
site? :)

Thx!

## 5247. BBS Days

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-19 06:26:25 UTC
From: jdplace@prodigy.net
Message-ID: <lkxab.3990$QO.3855@newssvr33.news.prodigy.com>
Source record: 19160

I received 50 e-mail messages containing viruses today! Most of them contained something about Microsoft. I don't think the computer world has improved. I miss the days when I could just dial-up the local Atari BBS. I guess I will have to change my e-mail address and SPAM protect it from now on. I can't take it anymore!

James I played that game a lot years ago on my 800xl and 130xe. It
required the XL Translator which made the 800xl and 130xe seem like an
Atari 800. Do as Thomas suggests and select the OS A Revision in your
emulator or use the XL Translator on your Atari 8-bit.

Bone Displ..

There I couldn't find it either. But the formax ftp has Sysinfo 2.03,
here you will find it:
ftp://atari.fornax.sk/pub/atari/8bit/UTILS/si203.arc

Unfortunately it isn't atr, anyways it shouldn't be a big problem.
Sven.

You are not alone in your difficulties with the massive amounts of email generated by viruses such as Blaster and Sobig.f. For the past month I have been getting total of about 100 emails a day from people who have been infected. Because of vulnerabilities in Microsoft products like Windows and Outlook millions of people suffer the same thing. Maybe this is even the average experience now. It is a real DoS attack (denial of service) for me as some days it will take 30 minutes to download emails and then I must delete 99% of them. So far I have not decided to abandon the email address, hoping that the situation improves.

In my opinion this is what happens when one company monopolizes the operating systems market and abusively wields that power to drive out competitors in apps (such as email apps) as well. We get substandard products because Microsoft does not have to compete. Few get Windows or Outlook because they have found them to be the best solution, they get these programs because that is what comes with the computer. Or because that is what everyone else has. Or because they have never seen any other such programs or operating systems owing to Microsoft's bundling agreements with computer manufacturers. There are many people out there who have never purchased a computer that did not have Windows on it already.

There is an alternative computer system that I am interested in that would be an improvement over this horrible situation. It is called Pegasos. It is based on the PPC microprocessor and runs a surprising responsive yet powerful OS called MorphOS. Pegasos is the hardware and MorphOS is the operating system. Pegasos will also run other operating systems. I encourage everybody to check out and be aware of this new system.

http://www.pegasos.com

So far there are approximately 600 of these out there around the world and the manufacturer Genesi says they are producing another 600 to be distributed as motherboard/processor/operating system bundles to

build-your-own computer hobbyists, and at that point they intend to mass market the machine in consumer-friendly pre-built form.

If you are anywhere near New York City and want to see the Pegasos in action you can go to the NYC Pegasos Users Group meeting in Brooklyn tomorrow (20 SEP 03) check out the following link for more:

# 5252. 8bit TelBBS for Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-19 13:12:43 UTC
From: jledger@cyberstreet.com
Message-ID: <706f6242.0309190512.5c55680a@posting.google.com>
Source record: 19165

Guys,

Several members of the (comp.sys.cbm) group have gotten
together to connect their 8bit machines to their broadband
connection using homebrew interfaces. The end result of
having original BBS programs connected to the Internet.
Being able to dial from an 8bit machine and connect to
an 8bit machine has been acomplished.

I've been keeping a website record of these activities,
(http://www.petscii.com)
but since I actually owned/loved several 8bit computers
over the years, I thought I'd expand the website to
include other machines doing the same thing.

I'm not sure if this has been done on the Atari
series, but the software and interfaces we've been
using should be compatible.

Can someone fill me in on what the Atari diehards
are doing along these lines?

Jeff

This is off topic, but I put a similar message in
alt.comp.virus.

Lots of people are getting mail floods/bombs, 100s
of virus attachments e-mails. For me it is gibe.c/gibe.f/swen.a, 106k for
each e-mail.

What I did was turn off 'automatically download messages when OE starts' in
Tools-Options-General.

Then my ISP has a www place to go in and remove
messages BEFORE they are downloaded. Call your
tech support and see if your ISP has a place to go and
remove messages before.

Regards,
Russg

I'm afraid I've forgotten Kilroy's actual name, but I met him once
many years ago. I don't recall now if he lived in Rochester or
Buffalo, but I drove down to have him upgrade my 800 to 288K. I think
I paid him $200 for the work.

# 5255. Atari Jaguar control pad on Atari 5200?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-20 00:53:14 UTC
From: LionOfJudah <bcozier@bellsouth.net>
Message-ID: <SwNab.2484$jO.2192@bignews3.bellsouth.net>
Source record: 19168

I know Best electronics makes a cable that enables the use of the Jaguar control pad on the Atari 8-bit computers but it doesn't look like they make one for the 5200. Why in the world not? The Jaguar control pad layout is pretty much identical to the 5200 with the "phone keypad".

The problem with playing games on the older Atari 8-bits is that the Option, Select and Start buttons are on the consoles...not much help when using an extension cable to play with on the couch. So the 5200 controller corrects that problem, however it's not made for the human hand (not that I can tell). Are there any well designed 5200 controllers that don't hurt your hands? Like the Jaguar control pad which would make my enjoyment of the 5200 games increase a thousandfold.

Any help or suggestions?

I'm using MyMail on my Falcon, which has the capability to delete the
messages before downloading (usually), but when there are a large
number of messages, for some reason it downloads them. I have most
of them SPAM blocked, but if I hit one it takes forever to download,
I usually hit 10 out of the hundred or so that I getting.

Same boat. My email is limited by earthlink to 10 megs of storage. Even with the option of using a web based email program, the 125+ emails with 156k attachments<20 megs so you don't have to get a calculator> has shut down my ability to recieve email.

Of course 90% of my email today is just some spam about refinancing my house so I can buy some viagra to make my penis 2" longer.

My disappointment with how the internet has developed over the last decade is showing. I'm thinking about just switching to a $10/month account and dropping some of my online activities. As BB King said "The thrill is gone, gone away for good!"

Message-ID: <vmq3tnncumqoa2@corp.supernews.com>
Source record: 19172

(responds to self.)
Uhhmmm. Not work, deleting before downloading.
My 25 megs are used up in a few hours.
So, I subscribed to my ISP virus remover. $2/month.
I may discontinue it after this blows over/subsides.
Seems like ISPs would catch that something is wrong
and block it. But I guess it is widely distributed, comes
from 1000s of infected computers, rather than a few
spam ISPs.
This swen virus/worm e-mail comes from usenet addresses in OE and maybe
plain Outlook, it doesn't
come from spamming e-mail lists.
Rambling again
And off topic to boot.

The reason they don't make one is because the 5200 can't use that kind of
controller. The stick part of a 5200 controller is analog (uses two
variable
resistors, or potentiometers, to vary a voltage signal). The D-pad on the
Jaguar controller operates on a digital principle - either the switch is
open
or closed.

When Atari made the 5200 controllers, marketing wanted an edge when it
came to advertising. They forced the engineers to design an analog
controller
so they can brag about how the 5200 controller has full 360 degrees of
control!

Another thing is the 5200 games are written to get the joystick inputs from
the POKEY chip. This is the chip that is used on the 8bit computers to read
the paddle inputs. Normally PIA chip is used to read the joysticks on the
8bit
machines. I don't recall exactly, but I think the 5200 lacks the PIA chip.
And
for games to even use a digital joystick input they would require to be
re-programmed
to support them instead of the analog controls.

Now there is always the possible idea of an external device that is
connected
between the 5200 and the Jaguar pad that could possibly translate the
digital D-pad signals and create an appropriate analog voltage signal to
represent
that particular directional movement. Use of a small microcontroller and
some digital to analog converter (DAC) chips would be a good start!

Hope this clears things up for you about the delimna that you face with
�*%�ng to interface a Jaguar controller to a 5200.

Regards,
Glenn

Have you ever heard of the competition PRO 5000 joystick? It uses a Y cable, on one end of the Y is the 5000 pro (digital) stick with 2 buttons and on the other end of the Y is a port to plug in the regular 5200 controller with analog sticks. You have to make sure the analog sticks are centered for the 5000 pro stick to work correctly....I was thinking that using this design it might be possible to convert the Jag controller and also enable the phone keypad on it...by still having it Y connected to the regular 5200 controllers.

# 5264. Realm of Impossibility cheat

(another EarthLink subscriber) I don't know if it's going to be worth it yet
or not, but I've been adding the addresses that this worm uses regularly for
from addresses to my "blocked sender list." They're not random, at least not
all of them, there are obvious patterns once you start collecting them. I
think I'm making headway-- On Friday my quota would be reached in about 45
minutes; last night I lasted over 4 hours. We only get to have 500 addresses
in the blocked sender list, and I'm around 350 now, so this strategy may yet
prove to be unsuccessful.

I'm assuming EarthLink's automatic spam detection will be adjusted to pick
these up within another couple days or so. Until this latest outbreak hit
they were catching maybe 80-85% of the spam, pretty effective.

It's do-able with a 1-pixel per screen refresh. Each frame buffer 1KB to another (buffered) bitmap and flip to the newly created screen (in another 16K video bank) when the finescroll register crosses its limit and is reset.

But add in full colour shifting (2K) and the new data (320 bytes vertical or 200 horizontally) and there's not much processor time left for the rest of the game.

Smooth scrolling was difficult for early (1982-1984) C64 programmers. Even worse time was had when splitting regions of the screen and you can see the horrible glitching in games like The Edge's "Wizardry" (not the Sierra game). Some game programmers got rather famous for the quality of their smooth scrolling (even if it hid non-existant gameplay), such as Tony Crowther.

You Atarians had it easy.

Where do I submit bug reports? In Star Raiders I cannot hit the meteorites nor the enemy space ships...the collision detection seems a bit screwed up....in Donkey Kong the barrel can hit me but I can't pick up the bonus items on the second level, even though I can remove the rivets from the ground...

I'm using NTSC...and OS B

The 9900 isn't a good choice for a 1k game. All opcode lengths are
multiples of two. Even NOP is a two-byte instruction.

>

The TMS9918A isn't a great chip when it comes to the high-res bitmap
(256x192 each character position allowing 8 rows of
foreground/background color) mode. Why? It has no scrolling registers,
all work is on the programmer, and it only has 16k and no banking
abilities. With the color table and pattern table consuming 6,144
bytes each, you don't have any RAM left for page-flipping like you can
do in regular Graphics-I mode (256 redefinable characters, 32
character sets each having a foreground and background color).
And that 1x8 color strip in bitmap makes scrolling horizontally a
nightmare. Unless you scroll 8-pixels (a full character), you will
need to limit to two colors or expect colors bleeding into images
until you have scrolled 8 pixels.

Now, the V9938 is a better choice, as it can have 192k VDP memory,
banking in 16k pages. I don't know the memory usage, but I'd expect
you could do some paging. I _really_ need to get into some V9938
programming...

> So, maybe a 6809-based machine with ANTIC, SID, a well considered
> memory map and a rich ROM to call would be a dream machine for 1K.

Yes, that would be a nice choice I'd expect...

BTW: Where is this year's minigame compo? Anyone got a URL? I couldn't
participate, but I'd like to see it.

Ben

Doesn't help. Two out of Three of my emails have it too. Just sit back, eventually some of the mail server administrators will figure out how much bandwidth is being wasted and how much that costs and should be able to install software to block it.

# 5272. combatting the spam deluge (was: BBS Days)

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-22 05:22:26 UTC
From: Edward Bonaventure <bard@tempests.and.teapots>
Message-ID: <Pine.GSO.4.56.0309220052470.20378@shell1>
Source record: 19185

On Sun, 21 Sep 2003 at 13:09:21 GMT, Michael Current scribbled:
->We only get to have 500 addresses in the blocked sender list, and
->I'm around 350 now,

I've noticed that in recent days this same topic has been brought up on several different newsgroups that I follow. Obviously the same thing's happening to everybody!

I'm using a completely different tactic with my e-mail program. (Which happens to be Pine, a Unix program which I'm controlling in shell mode, but which is actually running on my ISP's computer.) Instead of specifying specific addresses to block, I've specified about a dozen words for the Pine program's filtering to look for in subject headers of incoming e-mail.

I've also specified a couple of other fishy (and almost always phoney) items for the filtering to look for in half a dozen other lines of the message headers. (Meaning "long headers." While I have the program set for displaying only the short header version for regular use, there are some spammy items I've noticed in connection with certain other, more obscure header lines. Pine lets me filter for those too.)

Filling out Pine's form for 6 or 7 "rules" filtering for about 20 items in various header lines is a lot easier than compiling a list of 350 specific addresses! And it apparently works about as well as your list. Right now my rules are holding fairly steady at catching about 90% of the spam. None of that is based on checking for specific "from" addresses (but I could do that too if I wanted). It seems to me that my method is easier. ('Nuff said!)

(I'd better add that the above refers to my private e-mail address -- which is now getting 150 spam messages per day. For my public e-mailbox (listed below), Yahoo separates out most of the spam into a "bulk mail" folder which is easy to empty. I don't really know why they bother to preserve all that "bulk" mail at all, making us go to the trouble of emptying it. It's all worthless garbage, anyway!)

My strategy fails. It would take far more than 500 blocked individual addresses to make a dent against this worm.

If EarthLink's blocked address function took wildcards, then we'd have a chance.

For now, just have to wait for the "known spam" feature to be updated to catch this stuff. We'll all have trouble receiving any legitimate email until that happens.

## 5275. BASIC Tokenizer for PC?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-22 19:22:21 UTC
From: cmartin@ti.com
Message-ID: <482f186a.0309221122.7b9e802c@posting.google.com>
Source record: 19188

Does anyone know if there is a program that will run under linux or windows
to take a BASIC text file and tokenize it (turn it into a binary)?

I want to be able to scan in some BASIC text, then tokenize it and
turn it into something I can load under BASIC with
'LOAD"D:SOMETHIN.BAS"'.

Thanks,
Chris

You can use the ENTER "D:SOMETHIN.LST" command to load a file that is
pretty close to TEXT format...try using the basic command LIST
"D:SOMETHIN.LST" to create a file on your atari disk and examine it...it is
pretty close to TEXT format.

You might want to consider a utility that converts a text file (containing a
basic program ) into that same atari .LST format and then you can then ENTER
it into atari basic. That would be easier...unless the utility you want
already exists.

# 5280. FS:Factory-sealed ATARI XL/XE carts

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-22 22:32:34 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0309221432.4643f10c@posting.google.com>
Source record: 19193

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide :

$14 for a package of up to 15 games as surface mail (slow , 3-8 weeks)
$32 for a package of up to 40-45 games as surface mail (slow , 3-6 weeks)
$23 for a package of up to 8 games as Air Mail (fast , a few days)
$33 for a package of up to 15 games as Air Mail (fast , a few days)
$48 for a package of up to 40-45 games as Air Mail (fast , a few days)

Europe :

8.20 Euro for a package of up to 15 games
16.50 Euro for a package of up to 40-45 games

Please note : Paddles/Joysticks/Keyboard Controllers weigh about 3 times as much as 1 game.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias

ulrich_sternaxe@gmx.de

XEGS carts are the cartridge games in the blue XEGS boxes.They work on ATARI 800 XL , 800 XE , 65 XE , 130 XE and 1200 XL and the XE Gamesystem.

Some require 64K, so they woni¿½t run on the ATARI 800.

List :

Ace of Aces $7 XEGS cart
Airball $8 XEGS cart
Archon $6 XEGS cart
Ballblazer $5 XEGS cart
Crimebuster $7 XEGS cart
Crossbow $3 XEGS cart
Davidï¿½s Midnight Magic $5 XEGS cart
Desert Falcon $5 XEGS cart
Eastern Front 1941 $7
Final Legacy $5
Gato $5 XEGS cart
Hardball $5 XEGS cart
Joust $5
Loderunner $7 XEGS cart
Millipede (large box) $4
Millipede (small box) $4
Moon Patrol $6
One on One Basketball $5 XEGS cart
Pole Position $5
Rescue on Fractalus $8 XEGS cart
Robotron 2084 $6
RS Football $7
Star Raiders 2 $6 XEGS cart
Thunderfox $5 XEGS cart
Tennis $5

Disk :

Mickey in the Great Outdoors $3
Microsoft BASIC $10 (heavy box ,weighs as much as 9
cart games)

Cassette

Scram $4
Touch Typing $5

# 5283. Looking for disk utility

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-23 14:08:01 UTC
From: dunxuk@aol.commercial
Message-ID: <20030923100801.23549.00000063@mb-m03.aol.com>
Source record: 19196

Are there any suggestions for utilities that can 'refresh' a disk? In other words I need a package that will take a disk and copy it back onto itself without formatting, leaving bad sectors alone. I've noticed some of my earliest disks are getting a bit iffy and I could do with recopying them but I don't want to dupicate them onto fresh disks as they are originals.

Tia, Dunx

## 5284. Looking for disk utility

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-23 17:51:22 UTC
From: Roy G Biv <8-bitter@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.56.0309231313250.15063@shell1>
Source record: 19097

On 23 Sep 2003 at 14:08:01 GMT, Duncan Ross scribbled:

->I've noticed some of my earliest disks are getting a bit iffy and
->I could do with recopying them but I don't want to dupicate them
->onto fresh disks as they are originals.

Wow! Sorry, but I'm afraid I have to be rather blunt here. In my view you're going about this in entirely the wrong way. First, the one thing you should NOT do is to "write" onto your original disks. You should definitely be trying to recopy them onto "fresh" (i.e., different) disks.

Indeed, in a floppy disk-based system, all disks considered to be extremely and vitally important should be write-protected, with contents copied onto another disk; and then the copy (not the master) should be used for everyday usage, especially if any writing or revising is done directly onto that disk during program usage.

Back in the days when 8-bits were still a live platform I never heard of the concept of "refreshing" in Atari circles. That may be because it's so antithetical to the practical realities of floppy-based computing.

As for copying the disk, in its entirety, or sector-by-sector, or for copying specified individual sectors, various disk-operating-system ("DOS") programs do some or all of those things. If additional tools or more powerful programs are needed, I've used programs like Sector Editor (SecEd3) or Black Patch or Disk Wizard. Between them, they take care of all situations involving good sectors. For creating or dealing with "bad" sectors, there are programs like Disk Doctor.

If you have only one disk drive it's a pain to have to swap disks all the time in order to do the needed sector copying. But it's still a necessary thing, and these programs are written to understand the situation.

As I've said many times, floppies (and their accompanying hardware) should be kept away from dank basements and (most importantly!) cigaret smoke. And don't try writing on the back side of disks rated as single-sided. If you follow those rules, your disks should last forever.

If you absolutely must write on your master disks (that is to say,
ruin them), then before you do that I would suggest using a mild head
cleaner disk (non-abrasive type) on the drive. That might solve what
you think is the problem. I've found that my disks (maintained in a
dry, smoke-free environment) are still like new, but if I try to use
just one disk inherited from some other, former 8-bitter who smoked,
then my disk heads get dirty immediately!

Forget the C64 with itï¿½s ugly brown colors and beeping SID music,
forget the Spectrum - this is only a joke - and not a funny one.

Forget the ATARI 800 with itï¿½s ugly blocky graphics and 1-color
sprites.

The NES is far better than all these trashcans of computers !

Burn them and buy a NES !

Most of the games look bad - 50% are 1:1 Speccy ports and all the
games that look nice at first doni¿½t look nice when scrolling or
sprite-movement starts.

And for serious users - hey , in 1985 the ATARI ST was released and
the ST kicks the CPC to the moon.

So nobody needs this piece of shit.

Hmmm, I know of the ENTER and LIST commands, but I was really looking
for something that would cut the Atari out of the whole picture (at
least until I load the program, anyway). I have built a detokenizer
in PERL, I think I will just reverse the process.

Thanks.
Chris

Any reason you don't want to load the program with the ENTER command?

The only advantage of .BAS over .LST is the tokenized file takes up less
space on the disk.

You can still ENTER and RUN the propgram in a single line by appending : RUN
before pressing enter...

Oh...I'm wrong...with large programs ENTER can take a longer time than
LOAD..

I never had an ST back in the day, but I bought one a year ago and I prefer the Atari 8-bit to the ST. Except for the lucasfilm games on the ST, I still play the heck out of the 8-bit more than I do the ST which I rarely if ever use.

## 5299. The Atari ST would have been cool if...

Newsgroup: comp.sys.atari.8bit

Source record: 19111

They kept the same basic architecture of the 8-bits but expanded the capabilities...like player missile graphics just give more players/missiles and make them multicolored...and graphics modes...just give higher resolutions with more colors but keep the same principles of screen memory management and display lists etc...that way it would have made for a more enthusiastic reception by the Atari-8 bit programmers....why oh why didn't they do it that way...cause personally I think to learn to program the ST just sucks.

The NES is a 65c02 (yes the WDC based 8bit CMOS 6502). It has good color capabilities but the NES had far less RAM and an Expansion port originally designed for an early CD-ROM but I think will serve fine for a RS-232 or Ethernet communication but that is about it. Through you would need a ROM cartridge with a WebBrowser which doesn't exist from what I know of.

Though you need everything ROM based unless you have some sort of RAM board and MMU mechanism. Which is something we can look at doing via an FPGA but who uses the NES like a computer ????

It's less of a feeding the troll post than it is my voicing my
dissapointment over the ST...I was expecting similar sort of territory as
the 8-bit but more capabilities....but it was vastly different.

Check out the history of the 8-bits. The folks who had a hand in the
design of the 8-bits had a hand in the design of the Amiga (I believe).

As for why didn't they do it? The Atari STs are mostly stock circuitry. To
design all new custom ASICs would have drawn out the development, and they
were trying to beat the Amiga to market.

I'm so glad I never got into much heavy programming on any other computer
than the Atari 8-bit (except on IBM PC's for school when I was learning
pascal and stuff)

Can you imagine putting so much time and effort into learning a system
inside and out like the ST or Amiga, only for it to be outdated?

But even today I am just drawn to the 8-bit world of 6502 assembly and
display lists and all that great stuff. You know what would really be
cool -- if the makers of Atari 800 win Plus 3.0 could actually create a new
suped up Atari-8 bit computer using the current designs except expand on the
capabilities of the player missile graphics....give us more of them, and
make them multicolored and as much as 32 pixels wide....and a new graphics
mode like graphics 8, but supporting 16 or 256 colors, 16 would actually be
good enough.

I realize this would involve new design...but so what....we got all the
memory we want now and could even make the new graphics mode not use any of
the Atari 8-bit's native memory. In short....it would be creating a virtual
machine that is easier to program 2D scrollers and shooters or adventure
games in than using Direct X, at least for us programmers already familiar
with Atari 8-bit design....and we can still use 6502 assembler to write some
nifty and speedy routines to make use of the new graphics capabilities...

Such an emulator with those added features could then really be called
Atari++

(hint, hint :)

It sure does, I put many hours into NES Elite on my GBA with PocketNES. But
be aware that you'll have to modify your NES to run PAL games if you live in
the states, and even then, Elite has so many graphical glitches on a NTSC
NES that it's pretty much unplayable.

Too bad it wasn't released here, it's a kickass game.

What you have to do is one of 2 things: 1: mod the ps2 to read cdr(w)s or
2: use a usb cdrom/burner.

The builtin dvd rom drive only reads the following formats:
DVDs, audio cds, PS1, and PS2 game disks.

Ron

## 5312. To lazy to code it myself... :)

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-24 06:14:07 UTC
From: bill@newbreedsoftware.com
Message-ID: <PCacb.23916$dk4.762286@typhoon.sonic.net>
Source record: 19125

Once again, I'm too lazy/tired/out-of-practice to code something myself.

I was fooling around with designing some Super-IRG color palettes,
thinking "Hey, maybe it's time to write that asteroid game,"
and then got distracted. :^)

I created two palettes, one with:

Black
White
Red
Blue

and the other (for characters showing the '5th' color; e.g., chars with the
high-bit on, aka 'inverse'):

Black
White
Red
Green

In other words, think at first:

```
10 GRAPHICS 12
20 SETCOLOR 4,0,0:REM black (background)
30 SETCOLOR 0,0,15:REM white
40 SETCOLOR 1,4,12:REM red
50 SETCOLOR 2,8,12:REM blue
60 SETCOLOR 3,12,12:REM green (5th color)
```

In "Super IRG" mode, these will blend to provide:

Black
Grey
White
Dark Red
Medium Red
Light Red

and on characters (4x8 pixel cels) with high-bit off:

Dark Blue
Medium Blue
Light Blue
Purple

and with high-bit on:

Dark Green
Medium Green
Light Green
Brownish Yellow

So then I took the same photograph (of a 'hoverfly'; looks kinda like a bee),
and in The Gimp (a graphics program for Linux) did this:

Reduce size to 320x192 / crop as needed
Reduce size to 160x192 (dis-proportionate, but same _pixel_ size as
Atari GRAPHICS 12 / GRAPHICS 15 mode)
Apply one of the palettes
Resize image back to 320x192 (to get double-wide pixels, like on Atari)

Cool... Now a rather pixelated, dithery, kinda ugly 10-color representation
of the original 24-bit color photograph. ;^)

Now, I did it AGAIN, with the other palette. (The one with green instead of
blue.)

This gives me a similar, but slightly different representation of the
original photograph.

What I can do now is decide which parts of these two converted pictures look
best, and combine them. How? Well, just decide which palette to use in
which cells? The one with Black/White/Red/BLUE, or Black/White/Red/GREEN?
(e.g., is the character inverse, aka with-the-high-bit-on?)

I'm not sure if I did a good job, but here's what I did next:

* Reduce the original photo down to 320x192 pixels (crop as needed)

* Make a new layer; paste one of the Super-IRG paletted ones into it

* Change that layer's mode from "Normal" (replace what's below it)
to "Difference" (show the difference in color between the pixels and
what's on the layer(s) below)

I did this using both Super-IRG palettes, and then difference THEM to
get a horrible looking image which should tell me what parts of the image
will be best represented by one, or the other, Super-IRG representation.

Reduce to 40x24 (GRAPHICS 12 resolution, in characters), reduce to 2 colors
(black/white), scale back up to 320x192, and then VOILA! Use it as
a layer mask, and I end up with what SHOULD be the final picture on
the Atari!

So, I've got:

* Two palettes for Super IRG mode (see above)

* Two 10-color images which should be mappable to those two palettes,
and turned into a pair of Atari character sets

* A 40x24 grid of what characters will want to use the '5th color'
palette in GRAPHICS 12 mode

Anyone feel like writing some little tools (e.g., for Linux?)
to convert a 10-color PNG or PPM into a Super IRG font?

:)

No? Didn't think so. ;^P

# 5313. Atari at Vintage Comp Show

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-24 06:16:58 UTC
From: bill@newbreedsoftware.com
Message-ID: <uFacb.23918$dk4.762381@typhoon.sonic.net>
Source record: 19126

So far, I've not had much luck getting 'AtariSIO' (an SIO2PC/APE clone
for Linux) to run on my wife's laptop.

So, I think I'm going to just let the Atari800 emulator show off all of the
cool new stuff ("Space Harrier" clone, demos, etc.), and leave my REAL
Atari 800XL to do the mundane tasks of showing off innards and playing
games. (I think for simplicity, I'll stick to my small collection of
cartridge games, rather than bring a floppy disk drive with me. I really
don't have many working floppies left these days!)

Anyone else from around here going to attend the show?
It'll be Sat/Sun October 11/12th in Mountain View, Calif.

-bill!

Speaking of that, what kinds of things do people suggest I show off? :)

Off the top of my head:

Numen
Joy Ride
Drunk Chessboard

Hrm... I need to rifle around my 'demos' directory, obviously.
Been a while. ;)

For games, I've got:

Ball Blazer
Draconus [ I admittedly still don't own this! where can I buy it!? ]
Line-Up
Space Harrier
Star Raiders 2 [ to compare emulator to real; I'll be bringing my cart ]
Zybex [ see Draconus ]

Any other "Must See" stuff I should show off next month!?

# 5317. Numen - How do they do it? (NOT Vector!)

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-24 10:08:30 UTC
From: bill@newbreedsoftware.com
Message-ID: <y2ecb.23943$dk4.764824@typhoon.sonic.net>
Source record: 19129

Watching the Numen demo again, I still can't wrap my head around how they
did a lot of the effects.

Sure, the 3D bits from the upcoming 'Vector' game are pretty straight-forward.
REALLY good, fast 3D rendering in GRAPHICS 10 mode (with lower vert. rez.)

What _I_ don't get are a lot of the OTHER effects in the demo.
For example, the alpha-blending between an animated 'tunnel'-like effect,
and a static background image. Hell... alpha blending between two STATIC
images at ALL! It doesn't seem to be a flicker effect. (Or if it is,
Atari800 and my wife's laptop are blending it WAY too well :^) )

I realize (well, rather, guess) that a lot of even these screens are
still GRAPHICS 10 mode (80x192 with 9 palette colors), but palette tricks
can't explain ALL of this. :^)

Eru and Fox of Taquart... If you're out there, HOW DID YOU DO THIS!? :^)

Outdated, not outdated... Who cares? Look, what counts for me personally
is whether you had fun playing with the system or not. The Amiga was a
fun system as much as the Atari was. A really nice chip design - not as
boring as the PCs today - and quite capable for its time. So were the
Atari 8-bits.

> But even today I am just drawn to the 8-bit world of 6502 assembly and

The question is: What for? All that can be done in software nowadays
easily, it doesn't require special hardware. An off-the-shelf PC can do
it for you with the right tool.

> I realize this would involve new design...but so what....we got all the
> memory we want now and could even make the new graphics mode not use any of

If it's easy programming of graphics you're after, you might want to
have a look into the "SDL" library. That's a fairly portable graphics
engine that supports 2D and 3D (by means of OpenGL) graphics, working
both on in the win32 and Linux world. It's really easy to program...

> Such an emulator with those added features could then really be called
> Atari++

(-:

I'm currently more for perfect emulation... If you'd like "up to date" graphics, then the PC is what you need, why fit that into some kind of pseudo-Atari framework and introduce additional limitations the emulating system doesn't have in first place?

The Atari was great because it really represented a mile-stone in the graphics possibilities in the home computer marked, so did the Amiga. The next milestone was possibly the introduction of the 3D-world by means of cheap PC graphics cards, but that's already not bound to some specific piece of hardware. If you want to introduce something really original, the next milestone, then you have to come up with something really new, not an extension of old ideas - no matter how great or cool they have been back then.

So long,
Thomas

How is PocketNES running Elite these days? Last I saw it was still a
bit glitchy, though not unplayable by any means. This was using Ian
Bell's NTSC-hacked emulator version that he publically released, with
one of the tweaks you can use in PocketNES. Maybe I should try the
PAL version if PocketNES is able to handle PAL games better now.

Of course there's also Elite:TNK for the GBA

> Too bad it wasn't released here, it's a kickass game.

I agree. My "before playing" impression of the NES version was that
it would be clunky using a gamepad and select/start buttons in
combinations to replicate all the various things you can do with a
keyboard on the computer versions (looking behind or beside you, for
example). After I played the game, it almost seems natural to play it
in this fashion... very well designed (and kudos to Ian Bell for
supervising the NES port).

IMO though the *best* version of Elite is still the Acorn Archimedies
port. The NES version is a great port of the standard BBC/Speccy/C64
style Elite, but the Acorn version adds so much more and does it with
style -- without becoming too complex, boring, or as buggy as Frontier
(Elite II) turned out to be.

Regards,
Rob S.

It would really be nice if y`all wouldn't cross post. This certainly has
nothing to do with the Apple II newsgroup.

GoAT.

Besides the Apple IIgs pounds them all into the dust (similar to how
the SNES pounds the Genesis into the dust even though the Genesis has
a 68000 and the SNES has, like the IIgs, a 65816).

I forgot whether I used the PAL or NTSC-hacked version of Elite on
PocketNES, but it runs PAL games now. Elite is playable, but the PocketNES
seems to have trouble with mapping Elite's graphics to the screen.
Get a slightly older version of PocketNES if you can. The newest versions
supposedly fixed some bugs, but they actually introduced a lot of small
annoying bugs and glitches. Also, Sky Shark is unplayable on the newest
versions of PocketNES no matter what options you mess with, and many games
have flickery graphics somewhere in them now, like in status bars/title
screens/ etc.
I don't know what the revision number of the last good PocketNES version is,
but it's about 4 numbers behind the newest one.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I like how my 800xl has a standard built-in Atari BASIC. It would of been easier to program on the ST that way. I also like how the ST is best for Games in Low-Res Color at 320x200 and can do Low-Res while hooked upto the Audio/Video of Standard TV, giving me a bigger screen.

ATARI ST was a crappy system, worse than any IB M PC.Even the ATARI
800 from 1979 is far better !

Sure, but of course the Commodore C16 was the best computer ever built,
no Vax, Cray or PentiumIV can compete with it.

(Note: I am being ironic). :)

I'll be there.

Last year I had an enormous booth where I sold off a lot of my non-Atari stuff
(see http://www.vintage-computer.com/vcf5.shtml for evidence. Find "savetz"
- there are 5 pix).

This year I'm bringing less stuff to sell, but will be doing so at the
consignment booth. I volunteered to man the consignment booth, to stop
by to say hi.

I'll attest to that! I was one of the bigger customers until the auction at
the end of the show!

> This year I'm bringing less stuff to sell, but will be doing so at the

I'm pretty sure I'll have a few machines to put up for sale. It all depends
on what I can stuff into the car along with my display. Since I have a
display, anything I sell will be consigned.

See you there!

There was a thread on Atariage about this. You need to register to get the download button. Dracon posted it as an attachment in the thread at AtariAge.

Yes it's called the Amiga; it's key designer was Jay Miner, who designed the
800 chipset..

If Atari got there way, you could have been using an ST with this chipset...

Hi!

Any Atari system is great in my opinion. You are an atari lover or you are not (I guess). But I have to admit I love my atari 8bit more than my atari 16/32 bit system. And I have to admit too: the atari 8bit is more stable than the ST, but that's more thanks to the software quality on atari 8bit, and has not really something to do with the machine. Unfortunately there are many TOS versions, and many different types of atari ST mainboard types.

Marius

## 5356. The C64 is just an ATARI 800 rip-off!

Commodore stole the ideas behind this 1979 computer and made a crappy system in 1982 called the C64!

Incredible that they were not able to make everything better although the C64 is 3 years newer which means an eternity in computer business!

Commodore engineers were losers!

The GBA port is a freeware port of a PC version. GBA Elite has much better
graphics and music/sound than most ports. It feels like it was made just for
the GBA. But I didn't like it's menu system because I'm used to the NES
version.

Alien syndrome on the C64 is awesome! Especially with the laser weapons. I still play it with a friend and we set up a crossfire and stuff -- legendary translation of the game I still prefer it over the arcade version -- wierd I know, but it's just that they did the lasers so well.

The two player Barbarian fighting game is one of the toughest fighters I ever played to date. Timing and knowing what moves to pull off at the right time is crucial. I wish someone would make the exact same game today, keep all the moves exactly the same -- but upgrade the graphics and sounds of the sword clinging on sword and make the animation smoother and just a bit faster as well, I would be in fighter heaven.

I recently had a look at StarFleet 1 from Insterstel Corp on the Atari
ST...I was expecting it to be better than the 8-bit -- boy was I ever
wrong...the 8-bit interface and navigation controls and targeting is much
more user firendly than the ST. Just tends to justify all that you just
said.

Dude, do you know just how big a loser you come across as by posting
out-dated crap like this?

Go to REC.AUTOS.SPORT.NASCAR and say something bad about Dale Earnhardt.
That will get you some action.

Good luck.

Touchy touchy...so what's the big deal? At least I learned something I
didn't know originally that the C64 came out 3 years after the Atari 8-bits?
That is like an eternity in the computer business, well nowadays at least.
But I'm still happy there was a C64 back then so I could play games like
Pirates! and Zak McKracken etc....they weren't available on the Atari
8-bits...

If Commodore engineers were such losers, why did Jack Tramiel, after he went to Atari, lure a team of engineers away from Commodore to design the Atari ST?

BTW, you will have to do better than that if you hope to win the coveted "Troll of the Week" award.

Indeed, this is *twice* he's done this and in both cases it wasn't a
CSS regular...

# 5376. WTB: Atari 800 in Australia.

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-26 15:29:51 UTC
From: Paul <paulspam@e1designspam.comspam>
Message-ID: <PXYcb.124422$bo1.22719@news-server.bigpond.net.au>
Source record: 19089

Hello,

I am an Atarian that has been without an Atari for over 15 years! I was the proud owner of an Atari 800 with a 410 Cassette Recorder and an 810 Disk Drive. I had many, many games and utilities and was the envy of all my friends. As time passed, my Atari collection has long been lost.

I have used a few Atari emulators over the past few years, but they don't do justice to the real thing. So I am hoping to find someone out there who can help me with obtaining some Atari equipment. I have emailed Bravo Sierra, Video 61 and MyAtari - all of which have not been able to help me so far.

I am wanting to purchase the following items:

Atari 800 (48k) with BASIC cartridge
Atari 810 Disk Drive + DOS
SIO cable
Joystick

This list is a bare minimum, and if there are other items for sale I would be interested in these also.

I have a few questions though, which are:
a.. what are the shipping costs to Western Australia (postcode 6149); and
b.. who would the products be shiped by, how long will a shipment take to arrive using the different methods (air, sea), and what are the insurance costs against loss and damage
c.. Australia uses a 240V electrical system, so I assume that any equipment sent over from a non-240V country would require alternative power adapters - would there be any problem buying a generic brand from Tandy (Radio Shack in the USA)?
If you can point me in the right deirection as to who may be able to help I would be really appreciative.

Thank you for your time,

Paul...

Yes your're right : ANTIC !

And is everybody knowing that Player missiles was the first name of the
Sprites !??
In fact commodore never invented the sprites !
Atari did it before commodore ! The player was a sprite and a missile (a
small ball) was associated to each player !
4 player-missiles if I well remember, in the 800 XL.

Don't be daft, it was a development of the Vic 20.

I have an Atari800XL and that is not that much different to an 800 even
though its newer as well.

See my homepage, Atari in Czech Republic. It's described there together
with the schematics as it was invented here.

Be patient. The new beta 2 were to be released yesterday, but there
was still some bug related to atari800 sources and collision
detection. So we must wait for the atari800 team to correct the bug.

Well, I guess I should mention somthing about it. Yes, I have
been working on the hardware. I found out yesterday that the
way I have the CS8900A chip connected it is violating the timing,
but this is a simple fix (I need to swap one line with an
address line on the board layout).

Fortunately, I have my Atari 130XE and the ethernet prototype
in our Broadband Network Lab here at work, so I will be
debugging the hardware this weekend with UIP. Both
Adam Dunkels and Christian Groessler have been extremely
helpful in getting this working. UIP runs on the Atari, it
is just not recognizing the CS8900A because of the timing
issue.

Of course, several people have sent me emails saying that they
want one. If you want one, just send me an email. I am keeping
a perliminary list. There will be a run of boards made, but the
more the better, since the price will be cheaper.

I am not giving any dates yet on the production, since I am in
debug mode (and we all know debug can take some time). However,
that doesn't stop you from egging me on. :-)

The prototype:
http://jybolac.virtualave.net/atari/images/atari_a8_ether.jpg

Also checkout the 850 Manual that I am scanning in:
http://jybolac.virtualave.net/atari/850man/

Atari (Online) without the Price!

I'll have to seek out the archi version, I'd imagine there are emulators out
there that will run it.
The Nes version just felt right to me, and the graphics were pretty fluid
too.

Do you know if there was any custom chippery in the nes cart, or was it just
great programming?
I get weird graphics glitches with the emulators I've tried, so they must
have been doing something unusual to get that kind of speed out of it.

EXCELLENT! Star Raiders works perfectly now fromwhat I can tell also...

Also, with the sync blits to screen refresh option....the scolling on Zaxxon
has never been smoother.

Requires video card refresh rate to be 60Hz and in the atari in NTSC mode.

Because commodore stole the Amiga out from under Atari and they had to
cobble together something quick and cheap in order to get into the market on
time.

No custom chips, just 128 kilobytes of fast, tight code.
Have you set your emulators to PAL mode when you tried Elite?

Bring anything you like and that you think others might be interested in.
That's my rule of thumb, anyway.

I think Sellam would prefer displays to be up for both days, but I'll let
you work that out with him.

Hope to see you there!

So upload to this ftp: site in the upload directory..
Host: atari.xs4all.nl

Port: 21

User: atari8

Pass: atari4ever

I would love to try to get this on an Atarimax Flash cartridge. So you
could upload it also to www.atarimax.com and let us try to get it on a
cartridge.

I grew up on the Atari. Quite possibly the single most item that I grew up on in my youth. I hear so many things about Atari and the complete screw-ups that they made and I am so ashamed by it when I hear it. My Atari computer was a part of me, and in that respect, so was the company.

When I had heard that Atari once laid off its entire factory to move overseas, I couldn't find a hole deep enough to crawl into. Turns out that it was one of the biggest and most breaking mistakes that they made. Atari was truly run by firstly, a management that made some mistakes, and secondly by a management that did not care. I only wish I could do something to correct those mistakes.

I remember back in about 1983 when suddenly the games that ran on the Atari were quickly becoming few and far between. You literally had to search for places that stocked them. Then, later, I heard they stopped supporting the Atari 800 all together to bring about the ST. My heart nearly stopped as I had felt that I had been abandoned by a part of my own self. How about that mistake they made by rushing the construction of the "E.T." game and making way too many of the poorly constructed game that they ended up having to bury thousands of cartridges, the same game that they said would make the movie famous.

There is so much that Atari COULD have done that would have saved its ass. I ALMOST (not quite) wish that I grew up with an Apple or a Commodore. (ouch, that hurt)

I am curious, does anyone have some old copies of the Stock Reports that Atari was required to make when they were selling stock on the NYSE?

## 5403. Looking for old Atari NYSE reports

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-28 07:40:37 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <131c815da2bd8f50eace92b49bd8eaf4@news.teranews.com>
Source record: 19016

Stocks that sell on the NYSE are required to make regular reports on their companies and their finances. Does anyone have copies of these old reports?

## 5404. Where is Ray Kassar today?

Source record: 19017

I am curious. Whatever happened to that carpet salesman, Ray Kassar, who screwed Atari up backwards and forwards?

## 5405. Taquart's "TIP" format

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-28 11:22:33 UTC
From: bill@newbreedsoftware.com
Message-ID: <Zvzdb.25154$dk4.794243@typhoon.sonic.net>
Source record: 19018

Where can I learn about it? I'm checking out the Animkomials demo
for the first time, and was never aware of this mode.

I'm assuming, based on the name, that it's related to HIP and RIP.
How is it different?

> In Amiga they put the same technology bases ...and sure they attempted
> to let atari produce this new computer, but atari refused (an other
> stupid decision of atari !) and the guys went to Commodore and .....

This is one version of the story.

There is another version:
http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&threadm=
3dbd90ee.1906364807%40news.jersey.net&rnum=1&prev=/groups%3Fq%3Damiga%
252Batari%252Btramiel%252Bloan%252Bhaynie%2Bgroup:comp.sys.amiga.misc%26hl%
3Den%26lr%3D%26ie%3DUTF-8%26selm%3D3dbd90ee.1906364807%

which is much more likely to have happened

Atari thought they could have it cheap, and CBM took advantage of that.

I think the only ones posted by some of us are "commode is crap".
Any "Atari/abacus/stonehenge is crap" type stuff tends to come from other
places

Are you talking about Steve Sweet? If not, then who?

A check on google's history would show that I was posting here on and off
for a few years now, before I even heard of Steve Sweet.

In any case, that is no excuse to walk up to a complete stranger and tell
him that he is asinine, even if he is vaguely familiar.

Howdy folks

I quit university, which means my e-mail address and my site will cease to exist. They might throw out my site as soon as tomorrow, so if you want anything from my site please be quick. I have copied everything I have/had on my site to 3.5" floppy (I hope) so that if I find a new location for my site (this might take a long long time) I don't have to start from scratch again. If somebody wants to duplicate part or all of what's on my site please go ahead. As long as you don't make money with that information and as long as you inform people where you got the information from.

# 5428. Demos & games at Vintage Computer Show

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-29 09:40:16 UTC
From: bill@newbreedsoftware.com
Message-ID: <46Tdb.25531$dk4.798553@typhoon.sonic.net>
Source record: 19041

Okay, I'm obviously WAY too excited about the Vintage Computer Show
next week, what with my constant posting about it. ;^)

Anyway, here's what I've got lined up. I'm successfully able to boot
my Atari 800XL (256K upgrade) off of my wife's laptop, and have a very
recent version of the 'Atari800' emulator running on it, too...

Animkomials meets Boris Valleyo
Ass Kicker
Cool Emotions
Back to Life
Bill [Gates pie video]
Bitter Reality
Delirium Tremens
Drunk Chessboard
Drunk Tank
Fuji Boink
GTracker demo (side 2; the 'Prodigy' samples)
Halle 1993
Hobby Tronic 1992
Incredible
Joy Ride
More
Numen [only on emulator! I don't have 320K!]
Out of Time
Perform
Sweet Illusions
Tit
Ultra
Video [130XE video demo]
Your Body

As for games (on disk):

Ball Blazer
Berzerk
Draconus
Line-Up
Space Harrier [demo]
Star Raiders 2
Zybex

Any other suggestions of stuff to impress with?

-bill!

Thats a bit far fetched. The Apple II uses standard TTL/CMOS devices (a TON of them) to handle all of its video and computing ability while the Atari was designed from the ground up to use LSI devices.

I mean, yeah, the arguement COULD be made, but thats like saying a PC today with its integrated EVERYTHING is stolen from those early 8-bit computers.

Take a look at my pics from last year's VCF at
www.vintage-computer.com/vcf5.shtml. It'll give you some idea about what
folks do to make their displays a bit more snazzy.

I'd suggest some banners, brochures or other materials to add information
and history to your display.

Good luck!

> How is it different?

There's more info at:
http://www.s-direktnet.de/homepages/k_nadj/tip.html

Start with HIP mode:
Each line is made up of one line of Gr.9 on screen 1, one line of
Gr.10 on screen 2 swap between each screen on every VBI and the Gr.9
and Gr.10 lines blend together.

Now replace every other Gr.9/Gr.10 line with a Gr.11 line on both
screens. So you've got alternating greyscale (Gr.9/Gr.10) and colour
(Gr.11) lines running down the screen. Or at least that's my
understanding of what TIP mode is.

Cool, thanks! :^)

I'm not sure I'll have much more there with me than my Atari 800XL,
C=1902 monitor, my wife's laptop, and some little 8.5"x11" 'displays'
that talk about the Atari.

I might put together a handout for people to grab that includes refs to
FAQs, Emulators, newsgroups, IRC channels, etc. etc., though.

Am I right in guessing that there's not been much of an Atari 8-bit
precense at these events in the past?

Thx again!

Interesting. I didn't know it used GR10. I thought it was two GR9,
and used HSCROL to get the '160'-ish horiz. resolution.

Why GR10, exactly???

> Now replace every other Gr.9/Gr.10 line with a Gr.11 line on both
> screens. So you've got alternating greyscale (Gr.9/Gr.10) and colour
> (Gr.11) lines running down the screen. Or at least that's my

Hrm. Again, I'm not sure why GR10.

It sounds like Interlaced APAC, using HSCROL, would do more-or-less the
same thing.

I mean, obviously HIP, RIP and TIP all look quite good.
(Even compared to APAC, which when I looked at it again for the first
time the other day, seemed a bit more flickery and washed out.)

I just still don't understand the exact reasons for the use of GR10 mode.

:^/

Thanks for the link, though! I'm thinking of writing up some simple
'tech specs' on how some of these modes are created (APAC, ColrView,
HIP, RIP, TIP, Super-IRG), and placing it on my table at the Vint Comp Show

:)

I did basically that but printed them larger across multiple sheets and then glued those sheets to a piece of foamcore.

> I might put together a handout for people to grab that includes refs to

That sounds cool! Don't forget to mention the Vintage Computer Forum!! :)

> Am I right in guessing that there's not been much of an Atari 8-bit
> precense at these events in the past?

There has been next to none, which is surprising. There have been lots of Commodore, IBM, Apple, 8080/Z80 and similar 8-bitters but no Atari machines.

Next year I may do a "home computers of the 1980's" and bring an Atari 800, an Apple ][+, a Commodore 64, A TI 99/4a and one or two others. . . maybe I'll have them all running variations of the same game!

BTW, have you signed up at the Vintage Computer Festival site (www.vintage.org) yet? If not then you'll want to ASAP so that Sellam can assign you space.

Hello Chris,

I should be on that list. If not, put me there. A number of people
in my area have expressed interest also. I hope they email you as
well. Please keep us informed as to your progress. Thanks for all
the effort.....

Well, I guess it's cuz the Atari's are so cool that noone thinks of their's
as 'vintage.' "Whaddaya mean, 'vintage!?' I still use it!" ;^)

I'm already down as an exhibitor, if that's what you mean...
I've spoke with Sellam via e-mail a number of times.
(I said I might be a bit noisy, what with all the music... he said,
to paraphrase "right now! louder the better!" ;^) )

I would like to find an emulator (free if possible) that reliably runs on windows XP to emulate Atari 130XE. I miss alot of my favorite games like Castle Wolfenstein and Spelunker. Also if there are any preferred websites to download games, especially sites that have the largest collection, please post these sites. Thanks

# 5443. WTB : PAL Atari 8-bit with enough RAM to run demos

Newsgroup: comp.sys.atari.8bit

Message-ID: <cPjeb.33939$Hb.516165@news4.e.nsc.no>
Source record: 18956

I am desperately wanting an Atari, which can run the demos needing 320Kb and 512Kb (are there even bigger demos ? Seem to remember one needing 1024Kb) and it should be a PAL machine. Anyone has one for sale ? Also would like to buy a Black Box with drives (isn't there a floppy interface for it too ?)

Recommendations on where to look or offers are greatly welcome!

Have an Atarian day and take Atarian care

Hey Vidar.

Note that it's typically not too hard to get an NTSC Atari to run in PAL
by just swapping out the ANTIC chip.

Unfortunately, some demos actually check the OS ROM for a particular
value to see if it's a PAL machine or not, and then refuse to run if
they are. *grumble* I'd rather have a warning than a refusal. :^P

If you can find an NTSC 320K or 512K Atari XL, you can probably just
stick a PAL ANTIC in there, adjust the VHOLD on your monitor, and be set.
It won't be EXACTLY the same (colors may be off?), but things won't crash
and timings will be right.

I've stuck a PAL ANTIC in my Atari 800XL for my demo at the Vintage Comp Show,
since I'll be mostly showing some of the new demos (e.g., up to 10-15yrs old ;)

> don't care

That was uncalled for! It might be good if you showed some better
manners as well, especially since the person you replied to is very
likely *not* the person you think he is. If nothing else an apology
might be in order. Might be good to check e-mail addresses before
posting, too. Or, do like I do, and take each post as a separate
entity. If the person you are replying to uses bad manners and bad or
abusive language in their post, deal with it then if you want, and
then let it go. If they later post sensibly, then treat them with the
same respect that you would treat anyone else. And since there are no
doubt a number of similar, or even the same names floating around here
from time to time, it might be safer to just assume the best instead
of the worst.

Rather than tear my house apart looking for my mio adapter for my 130xe,
i've decided to install a Ram upgrade in my 800xl. Which ones do you guys
recommend? I am waiting on the OS Warp upgrade from Steve Tucker to install
so it would need to be compatible.

Thank you! (I would also like to use my MIO on occasion)

To take advantage of a GTIA bug/feature where GR.10 screens are
shifted by half a pixel when compared to GR.9 and GR.11 screens.

> > Now replace every other Gr.9/Gr.10 line with a Gr.11 line on both

I'm not 100% sure on this, but I thought HSCROL would only scroll in
pixel increments, so it can't scroll 1/2 a pixel even if it is a 4x1
GR.9/10/11 pixel.

It'd be nice if you could scroll 1/2 a pixel though, especially if it
worked in GR.15. Then you could do something similar to HIP with
GR.15, having 9 greys with an apparent 320 horizontal resolution.

> Thanks for the link, though! I'm thinking of writing up some simple
> 'tech specs' on how some of these modes are created (APAC, ColrView,
> HIP, RIP, TIP, Super-IRG), and placing it on my table at the Vint Comp Show

I was thinking of compiling something similar a while back, but there
just aren't enough hours in the day =) It'd be nice to see a webpage
that explained all the different modes, with advantages and
disadvantages.

Okay, that makes sense. (I'll have to play with this on my own 800XL
and on Atari800 emu to see :) )

> It'd be nice if you could scroll 1/2 a pixel though, especially if it
> worked in GR.15. Then you could do something similar to HIP with

I don't think you can scroll even a 320 screen (e.g., GRAPHICS 8) by
a single pixel. That's a half a color clock, isn't it?

I didn't realize that you couldn't shift a GTIA mode (9/10/11) a
single color clock (1/2 a GTIA pixel), though. Kinda hard to believe,
but I'll trust the coders in Hard, Taquart, etc. ;) ;)

<snip>

# 5451. Utilities for cassette image files (.cas) updated and added XEX2CAS

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-30 22:45:32 UTC
From: "Ernest R. Schreurs" <ernest@wxs.nl>
Message-ID: <tu0knvspfta33hthc4e5o88k3l9itai8cr@4ax.com>
Source record: 18964

Hi All. It has been a while since I posted something here. Today I updated my homepage a bit. My page contains several programs for the die-hard Atari cassette users. There are still lots of those around. The wav2cas program that I wrote in may of 1997 has been updated slightly. Some users had problems with the .wav files that some sampling programs produced. I have modified the program such that it will now skip the parameters that used to confuse it. Also, since I happened to be using a program that could only sample 16 bit values, I added support for 16 bit samples too. That is not more reliable, it just takes up more space, but that particular program could just not be forced to use 8 bit samples. Sounds familiar, forcing people to use 16 bits. I have not tested it a lot, so if you download it and discover a problem, let me know.
For those of you that were not able to process .wav files before, this new version might work with your setup now. If not, let me know.

Also, I have added a program that another Atari user sent me.
It will let you take a DOS file, i.e. a .com or a .xex file, and then create a .cas file out of it,optionally adding a boot loader. After writing it to a real cassette with the cas2wav program and a .wav player, the tape can then be used on a real Atari. This allows users to download stuff from the internet and write it to real tapes. I suppose this would also work for .bas files. Give the program a try, and send the author your comments!
Also, I have added a link to the ATART program webpage, which allows editing of .cas files.
My webpage is still at
http://home.planet.nl/~ernest

Keep those XL's/XE's buzzing!
Ernest.

You think that's easier than finding a PAL one ? Might consider that. How hard is it to get RAM into the machines ? I have a couple of unmodified 800XL's. Would it be soldering involved there ?

> I've stuck a PAL ANTIC in my Atari 800XL for my demo at the Vintage Comp
Show,

Hello Mike,
Thanks for the backup, but I had no expectations that someone that would
write something like this...

> > What a shame!! if you had found one we wouldn't have had to put up with
your
> > bad manners on this NG, I fully expect an abusive bad language reply but
I
> > don't care

...to ever apologize. Seems to me that he is the one with bad manners and
abusive bad language and I wouldn't expect him to apologize any more than I
would expect some ghetto trash to do something as simple as giving up his
seat to a blind man on the bus. Such things are common sense to us, but not
to people of his sort.

Please re-read my last reply. It applies to this post as well. BTW,
does "Alan" look *anything* like "Mike"? My guess is, just another
troll, with a response like that. Until I hear some half-way
reasonable discussion, I will not reply again.

Source record: 18970

Hmmm,
I do not know of any ABBUC Mega-CD (allthough I am an ABBUC member!).
But I do know the following ABBUC CD`s:

- Pooldisk Two by Bo & Ernest Schreurs, two CD`s filled with lots of
Atari stuff
(ATR-Images, JPEG-Pics, HTML-texts, etc. etc.); usable on the PC not
on an Audio-CD-Player...

- Atari on Radio, one CD filled with a recording of a radio-session at
"Basic FM, Bremen" that had to do with Atari; the german radio-station
and their moderator dealed about one hour with the subject atari;
someone recorded this, so you can now listen to the CD with any
Audio-Cd-Player...

- ABBUC-Super-Video-CD, an S-VCD filled with 3-4 videos from various
Atari events; afaik it contains some videos from abbuc meetings
(schreiersgruen for example) and a video from a tv show called "Neues"
(news) of a german tv station, named 3sat, that dealed with the subject
ABBUC in one of their tv shows. This CD is only playable on CD/DVD
players, that are able to playback Super-video-Cd`s. afaik, the CD is
also available as a PC-CD, containing MPG or AVI videos...

Well, these are all ABBUC-CD`s I know at the moment... greetings,
Andreas.

Ah,
now I know - he is talking about the hardware project, to playback "turbo-tape" programs from CD (with the use of a small interface)... It is a nice project, but with many dis-advantages: a) you can playback/load only files (no boot-disks!), b) it uses the turbo-tape format, which is faster than normal tape, but still slower than disk drive; c) the drivers for this hardware must be loaded from turbo-tape or from cartridge (and since no-one sells those turbo-tapes or those cartridges, you have to do them yourself!)... greetings,
Andreas.

Source record: 18973

Well,
it is Gr. 10, because the GTIA has a bug in Gr. 10 mode - this bug, when used with good knowledge will produce a resolution of 160x... instead of 80x192 (which is standard for gr. 9/10/11). To me it seems sad, that the bug appears in Gr. 10 instead of Gr. 9 or 11. Would it appear in Gr. 9 or 11, one could combine these modes and get a Gr. 9+11 picture with 256 colors and a maximum resolution of 160x238 pixels. Alas, it appears in Gr. 10, which means we do not have so many colors in RIP mode (Gr. 9+10) and we do not have such a high resolution in TIP mode (gr. 9+11 or 10+11). Anyway, it is a nice "bug", which gives us many new graphic modes and resolutions... -Andreas.

# 5461. Re: WTB : PAL Atari 8-bit with enough RAM to run demos

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-01 19:17:49 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F7B285D.2E56766E@students.uni-mainz.de>
Source record: 18974

Hello Vidar,
afaik there is no demo, that requires 512k extra RAM and just one demo, that requires 1024k extra RAM. The one demo for 1088k computers is a german demo, called "1MB Raytracing demo", and it requires a klaus Peters 1 Megabyte Ramdisk (it will not work on any other Ramdisk, because of the strange and non-standard bank-switching method, the KP Ramdisk uses). Besides, this demo runs off of 8 bootdiskettes, with or without (?) speeder and takes 17 minutes of loading time...

The reason to have 512k extra RAM (or 576k machines) might be to run both demo variants, that a) require 26AE (Compyshop and Megaram RDs) or b) 8ACE (Newell, Rambo, Toms, S.Peterson, etc.) Ramdisk blocks. In my collection of demos, I have approx. 60% that run only on 26AE ramdisks, 20% that run on both Ramdisks and approx. 20% that run only on 8ACE ramdisks (speaking of 320k demos here; the 128k demos will of course run fine on both ramdisk types; also most 192k demos run fine on both ramdisk types). in other words, if you have 320k of RAM you might be restricted to one side, if you have 576k or more you can run almost all demos. Only the mentioned 1MB-demo will not run and the Video-Blitz demo also will not run, since it requires separate antic access (maybe one can fix this)...
greetings, Andreas.

P.S.: I first had a 320k atari with 26AE ramdisk, then I installed a switch, to switch the rambanks between 26AE and 8ACE mode, until I finally upgraded to 576k RAM. If you already have 320k RAM, why not install a simple switch ?!? I found out, that some few games and apps that did run fine with 320k, do not run with 576k RAM anymore (so I installed a switch again, to switch down to 320k RAM)...

Hey all,

I am preparing to move to a new apartment and I found a few old input
devices I thought someone might like.

* Atari ST mouse (missing its ball)
* 2 Atari 8-bit paddles (its a dual paddle (one connector) with tennis logo)
* Original Nintendo controller, hacked to work with Atari 8-bit/ST
(The A-B buttons both serve as a "fire" button. Select & Start don't do
anything)

If you're interested, please contact me by email:

Oh, the GR10 bug actually produces 160xX resolution?
I misunderstood, then, and thought it merely shifted the frame 1/2 pixel
(1 color clock) left or right.

Wow! So at 160xX, how many colors do you get? I can't imagine how you'd
get more than a GR15 mode, since you can only pack so many variations
into 40 bytes! :^)

Not if they're socketed! :^) My 1200XL and 800XL were both.
It's sometimes a little hard to pull them out. I use a screwdriver for
leverage. Most of you would probably faint watching me. ;^)

<snip>
> Bastards ;-)

It could be as easy as finding and changing one byte in the demo's
binary. >:^)

Good luck finding it, tho! :^( So many demos use compression & stuff.
It might be easier to just hack a PAL ROM, either in software (probably
wouldn't work with most of these newfangled demos) or by burning a ROM
replacement. (Don't ask me how!)

<snip>
> You think that's easier than finding a PAL one ? Might consider that. How
> hard is it to get RAM into the machines ? I have a couple of unmodified
> 800XL's. Would it be soldering involved there ?

Soldering here, yes. I've never done it. My 800XL and 1200XL have 256K
inside. (Bob Woolley still has my 1200XL!) I didn't do the upgrades, tho...

Gotta run,

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

# 5475. Re: Taquart's "TIP" format

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-03 10:08:52 UTC
From: Daniel Miller <daclmi@mediakingx.com>
Message-ID: <gfiqnvgrrhaa3h405c3842u8k7rmmdnsnf@4ax.com>
Source record: 18988

I read these threads and follow the links, but it is a bit much for an amateur like me to assimilate. I am interested in getting paint programs for my Atari 800, capable of the following modes:

HIP
TIP
APAC

Anyone know of any such paint programs? A separate wish is that I had a paint program which used my Atari ST mouse which I use on the 800.

PS: AtariAge is such a great site! I did not know about it until a couple months ago, but am glad I found it!

You are right Bill - the "bug" only shifts the frame 1/2 pixel.
To get the perceived 160 resolution you use the same clever trick as
Super-IRG to fool the eye.

:-)

Unfortunately not =( It's just a standard GR.10 line that's being
used. It's the "used with good knowledge" bit that gives you an
apparent 160 horizontal resolution.

Yes. Something like a 14 pin dip<LM7sumtin?> and power transistor. There are at least a couple of types of 800XL supplies out, so I have no doubt there is more then one type.

> modes and resolutions...

Actually, I doubt that this is a "bug". This delay of one color clock in
Gr.10 is IMHO required for the additional look-up step in the palette
registers of GTIA that does not take place in Gr.9 or Gr.11 where the
color comes directly from the input data.

So long,
Thomas

# 5486. Re: Atari 800 in Australia.

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-04 02:40:08 UTC
From: james.moulder@clear.net.nz
Message-ID: <6d77fe70.0310031840.86a7028@posting.google.com>
Source record: 18899

I have purchased a fair bit of Atari kit over the past few years in
both New Zealand and Australia. The 400/800 stuff is quite hard to
find, I have picked up Atari 400,410,800,810,820,830,835,850's on
ebay.com.au over the past three years. Prices range from a few $'s to
over $100 esp for good MIB (Mint in Box) 400's.

If you go to ebay.com.au and search for Atari then scroll through the
pages of 2600/5600/7800 stuff and look out for the occasional
8bit/ST/TT item. Currently a 800XL is for auction, at around $15.
Bottom line is you need to be patient and be ready to compete with a
few guys that also are keen on the ole Atari's.

I guess it's also like a horizontal APAC or ColorView trick, at the same
time... in that it's blending pixels left and right.

Makes me think of FlickerTerm 80's PMG-based highlighting
(in that the accuracy can't be perfect)

Anyway, gotta run :)

-bill!

Source record: 18903

It would help if you described what writeatr does.
I think it must be a PC utility to write .atr files
to 5 1/4" floppy. Is that the case? Or is it a Atari
utility that writes .atrs?
Not familiar with that program.

# 5491. Re: writeatr problem

Source record: 18904

If it does what I think it does, use a PC to write ATR's out to floppy- then you will need some very specific equipment to do that.
You need a floppy drive that can do single density, a 360K drive- NOT a 1.2mg (High density) drive.
You also need a disk controller card that can do single density. Alot of the older Adaptec SCSI cards can handle that no problem, the real problem is finding a real 360K drive. Some of the older IBM AT's have them, don't use any Tandy drives- too much trouble to reconfigure for IBM use.
The best solution and the one that I use, is to get a 1050toPC cable off of Ebay and plug a real Atari drive into your PC's serial port. You'll be very glad you did, it makes things alot less troublesome and time consuming.

->You need a floppy drive that can do single density, a 360K drive-
->NOT a 1.2mg (High density) drive.

Note that the 360K referred to here as "single density" is from
the perspective of what used to be called "IBM clones." On the
Atari side, Atari "single density" is something else.

I have a 1.2 megabyte (high density) 5.5-inch floppy drive in my
IBM clone. The program called "My-Util" reconfigures it to handle
"Atari true double-density" disks. The 1.2 mb drive is not limited
to working only at 1.2 megs.

Atari was privately held from its inception in 1972 to 1976, so there weren't shares of Atari stock over that period.

From 1976-1984 Atari was a division of Warner Communications. Warner was certainly a public company, so Warner financial statements over that time period would have had to cover the Atari division. (For a while Atari was making far more money than any other part of Warner Communications.)

You're absolutley correct. I piddle around with so many brands that I forget single density is not so universal. I also just remembered that a 360K drive is actually (in most computers) a 180K double sided drive. Same difference for what he's trying to do though I think.

Could you please send some more detailled information?

- What kind of floppy drive do you have in your PC (5.25" / 360k or
1.2MB)?
- Which floppy drive do you use with your Atari (XF551, stock 1050,
1050 with US-doubler/happy/speedy/..., Rana, ...)?
- Which kind of media did you use (360k DSDD or 1.2MB DSHD disks)?

so long,

Hias

I hadn't. I use 68030/68040 Macs all the time. Rainbow is awesome on
that. It made perhaps the best use of the system speed that it could, and was
a fairly complete emulator. I registered that program a LONG time ago. Loved
it ever since.

Source record: 18917

FamilyNet Newsgate

Plugged back up my Atari 800 the other day. Slapped in Star Raiders, thought I would tinker around. Was about to hit start on a Novice mission, and thought... nah... been doing this for 20 years... even tinkering by now should be a COMMANDER mission.

Flew through, strafed the bad guys from sector to sector to sector. And then I decided the energy was getting low. Thought for that extra challenge I would see what I could get done with what I had left. I warped across the galaxy. And when I arrived I had 326 (out of 9999 for those who have never played this) left. Thought "Whoa cr*p..." and realized I had no energy left to chase, to fight... but maybe.. just maybe.. I could get in one last jump.

Set a course for the nearest starbase, made the jump. Luckily it was in the next sector over. Arrived with 65 energy left. By the time I was done docking, I the energy counter was down to 19! (Yeh yeh... I should have waited till it said "0007" right? LOL)

Jumped out of there, and won the day. But I don't think I've ever cut it that close on the energy. :)

I knew that, but for some reason it didn't register until you explained it. Since the golden years of Atari was primarily from 1980 - 1983, that would mean Atari didn't really start selling stock until after the software game crash of 1983.

That's too bad, because that is primarily what I wanted to read about in the stock reports. I wanted to see what they had to say about it as well as their future perspectives on the situation. If I recall correctly, that was also about the time that finally got rid of that idiot Ray Kassar "The Czar" who totally screwed up Atari to begin with.

->I piddle around with so many brands ...

Glad to hear that somebody's still tinkering around with the old
computers!

->I also just remembered that a 360K drive is actually (in most com-
->puters) a 180K double sided drive.

The Atari 8-bit's "single density" is 90K on a one-sided disk, or
180K for both sides on a disk rated as two-sided.

It might also be noted that people on this newsgroup have said
that high density (1.2 megs) disks can't be used for 8-bit purposes.
(I.e., formatting at 360K or lower.) I never tried to test that,
but it sounds like good advice.

# 5503. For Sale:New+boxed ATARI XL/XE cartridge games

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-06 04:15:15 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0310052015.1e7e2a0f@posting.google.com>
Source record: 18914

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide :

$7 1 game surface mail (slow)
$9 1 game air mail (fast)
$14 for a package of up to 15 games as surface mail (slow , 3-8 weeks)
$32 for a package of up to 40-45 games as surface mail (slow , 3-6 weeks)
$23 for a package of up to 8 games as Air Mail (fast , a few days)
$33 for a package of up to 15 games as Air Mail (fast , a few days)
$48 for a package of up to 40-45 games as Air Mail (fast , a few days)

Europe : please ask

Please note : Paddles/Joysticks/Keyboard Controllers weigh about 3 times as much as 1 game.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias

ulrich_sternaxe@gmx.de

XEGS carts are the cartridge games in the blue XEGS boxes.They work on ATARI 800 XL , 800 XE , 65 XE , 130 XE and 1200 XL and the XE Gamesystem.

Some require 64K, so they woni¿½t run on the ATARI 800.

If you need pictures, scans of boxes or photos of
carts+boxes+insturctions, please ask!

List :

Ace of Aces $7 XEGS cart
Airball $8 XEGS cart
Archon $6 XEGS cart
Ballblazer $5 XEGS cart
Crimebuster $7 XEGS cart
Crossbow $3 XEGS cart
Davidï¿½s Midnight Magic $5 XEGS cart
Desert Falcon $5 XEGS cart
Eastern Front 1941 $7
Final Legacy $5
Gato $5 XEGS cart
Hardball $5 XEGS cart
Joust $5
Loderunner $7 XEGS cart
Millipede (large box) $4
Millipede (small box) $4
Moon Patrol $6
One on One Basketball $5 XEGS cart
Pole Position $5
Rescue on Fractalus $8 XEGS cart
Robotron 2084 $6
RS Football $7
Star Raiders 2 $6 XEGS cart
Thunderfox $5 XEGS cart
Tennis $5

Disk :

Mickey in the Great Outdoors $3
Microsoft BASIC $10 (heavy box ,weighs as much as 9
cart games)

Cassette

Scram $4
Touch Typing $5

# 5504. Atari History Questions

Newsgroup: comp.sys.atari.8bit

Message-ID: <85d4a3ced5c408c3c68b8a34561c35c8@news.teranews.com>
Source record: 18915

I am currently looking for information on old stock reports for Atari around the ages of 1979-1985. Since Atari was owned by Warner Communications from about 1979-1983, and was one of its biggest money makers at the time for that company, I assume that the information that I am looking for would be in that area.

I am having troubles locating the ticker symbol for Warner Communications in that era, would anyone here happen to know it?

I am interested in getting the stock reports because I would like to review the financial information before, during, and after the era of "The Golden Age" (1980-1983) of Atari and see exactly what the company thought of itself in that time frame, as well as what they were planning for in the future.

Can anyone help me here?

Thanks

Yes, you could try ARFD but you would need a 1050-2-PC hardware for that. Or
APE/ProSystem.
Making Atari floppies in PC floppy drive is _very_ tricky.

Okay, based on Piotr Fusik (Fox/Taquart)'s description of RIP
( http://www.s-direktnet.de/homepages/k_nadj/tip.html ),
it sounds like the resolution ends up being 80 x 96.

Is that right?

Has anyone calculated the number of colors it can produce?
(e.g., HIP is 160x192 with possibly 30 shades)

Also, how many colors can RIP do? (Is it, like, 30*16 colors at 160x192?)

Thanks! :)

Note sure when Time merged, but back them it was Time Warner also. So
you might want to look up that ticker also. They just dropped AOL
from their name and changed back to their old ticker name.

Good luck on your quest.

Source record: 18924

OK, I think you're saying writeatr is a PC program
for use with PC 5 1/4" drives.
A good program would sense things about your
PC and report to you. Apparently writeatr doesn't
do much 'error' checking.
You can't make single density disks with 99%+ PC
5 1/4" drives. However 99%+ .atrs are 90k single density images.
Someone has said even writing double density 5 1/4" disks on a PC, for
reading with an Atari disk drive is very tricky.
One thing is for certain, you can't use high density 5 1/4" disks for any
Atari purpose. Double density disks almost always have the hub ring on
them, high density almost always don't have the ring.
If you're trying to make disks for use with an Atari disk drives from .atrs,
the best solution is to use APE or SIO2PC and a real Atari drive, or use the
10502PC interface, again using a real Atari drive to do the writing.

That's correct. You can download it from my homepage
http://www.horus.com/~hias/atari/ . The zip-file also contains
the documentation with some background information about
Atari disk formats and PC floppy controllers.

> A good program would sense things about your
> PC and report to you. Apparently writeatr doesn't
> do much 'error' checking.

A good author would inform himself before posting wrong statements :-)

Actually, WriteAtr does a lot of error-checking and you can increase
the verbosity by adding the '-d' command line option one or two times.
Of course, it is always possible to improve the output or to add some
more information - if you have some suggestions, just drop me a line.

> You can't make single density disks with 99%+ PC
> 5 1/4" drives.

This is only partially true.

First of all, it has nothing to do with the PC floppy disk drive.
Even more, the drive type (1.2MB vs. 360k) doesn't matter. Both drive
types can read/write Atari disks equally well.

The main issue with PC floppy drives is when they are misaligned or
simply dirty/dusty/... the Atari floppy may have problems reading the
disks. BTW: A small misalignment of a HD (1.2MB) drive may be worse
than the same misalignment of a DD (360k) drive, because the R/W-head
of the HD drive is somewhat smaller.

The real reason you can't read/write SD or ED disks with most PCs is
the floppy controller used in the PC. Many controllers don't support
FM encoding (used by the SD Atari format), and also many controllers
have problems with 128 bytes per sector formats (SD and ED Atari
formats).

I made a few tests with some different floppy controllers, the two
oldest controllers (ISA "multi-IO" boards) could neither read nor
write ED, the onboard controller of a ALI-chipset mainboard used in
my Pentium-MMX computer could read _and_ write ED, and two of my
PCs with a Intel 440BX chipset (Asus P2B and P3B-F mainboards) could
write but not read ED.

> Someone has said even writing double density 5 1/4" disks on a PC, for
> reading with an Atari disk drive is very tricky.

This is not true. All PC floppy controllers have native support for the
double density format (256 bytes per sector in MFM). But, indeed, it is
tricky to read Atari-formatted DD disks in a PC drive.

The main cause for failures is still a broken/misaligned/dirty/...
PC floppy disk drive.

> One thing is for certain, you can't use high density 5 1/4" disks for any
> Atari purpose.

That's true - a HD drive can cope with both DD and HD disks, but using
a HD disk in a DD drive (such as the Atari disk drives) is a big no-no.

> If you're trying to make disks for use with an Atari disk drives from .atrs,
> the best solution is to use APE or SIO2PC and a real Atari drive, or use the
> 10502PC interface, again using a real Atari drive to do the writing.

ACK. And this is also the only working solution if you want to access
the second side of the disk by simply flipping it. Back in the 80s
special "double sided flip disks" with two index holes were sold,
but they were very rare and uncommon.

so long,

Hias

Greetings Everyone,
In my search of Atari History, I came across a bit of a mystery. Perhaps someone here knows something.

In 1981, Atari was going through one of their biggest and best years. Warner Communications, the parent company for Atari, either did not file a required yearly 10K SEC filing for the stock market, or the Library just simply doesn't have any record of it.

Does anyone know anything that might have caused Warner Communications to have not filed the 10K report for 1981?

# 5518. Atari Mystery 1981

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-07 00:56:55 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <a1ddc3cef5cd131a67becb53af5de9f1@news.teranews.com>
Source record: 18931

Greetings Everyone,
In my search of Atari History, I came across a bit of a mystery. Perhaps someone here knows something about it.

In 1981, Atari was going through one of their biggest and best years. Warner Communications, the parent company for Atari, either did not file a required yearly 10K SEC filing for the stock market, or the Library just simply doesn't have any record of it.

Does anyone know anything that might have caused Warner Communications to have not filed the 10K report for 1981?

I plan to do that, put it in pdf format. I am still trying to get the
quarterly reports now. I found a library that might have them, but they are
being a bit difficult.

## 5523. atr to pc floppy help please,,,

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-07 08:10:10 UTC
From: Roy G Biv <8-bitter@uh-tar-ee>
Message-ID: <Pine.GSO.4.56.0310070352010.11159@shell1>
Source record: 18936

In article (oqHfb.18050$ko%.290@news04.bloor.is.net.cable.rogers.
com), "Michael" scribbled:
->>i am using writeatr to put atr files onto 5-1/4 floppies,, but my
->>atari will not read them, ...is there other software i could try?

Other replies have given a lot of good information but I'm the
only one who mentioned the "My-Util" program. Apparently nobody else
uses it anymore. A decade ago "My-Util" (a.k.a. "Util") was all the
rage.

A question for the original poster (Michael): Are your Atari disk
drives single density capable (128 bytes per sector) or "true" double
density capable (256 bytes per sector)?

I gather you're looking for a program to run on a "PC" (a.k.a.
"IBM") clone or some computer emulating a clone. Almost all of the
programs I've seen mentioned here during the last decade have worked
at the 256 b/p/s level and thus required "double density" Atari disk
drives. As somebody else noted, the most common Atari 8-bit floppy
drives were only single density. If that's your situation, it would
explain your difficulties.

Hi,

> For a while now, I have attempted to try programming in Assembly Language
> for my Atari but have had some troubles, primary with Syntax regarding the
> use of the MAC Assembler.

The syntax of the Mac/65 is actually plain 6502 (Synertek) syntax,
there's nothing special about it. However, you need to put a

10 .OPT OBJ

in front of your program to make it assemble into memory.

> Anybody have some good suggestions, references, or ideas about how I can get
> the hang of this?

I would recommend this book for "generic" 6502 programming:

6502 Assembly Langauge Programming,
Lance A. Leventhal, Berkeley: Osborne/McGraw-Hill, 1979

and, of course, the Mac/65 manual.

So long,
Thomas

Close one! Did you remember to switch off all non-esentials when you
could? (shields, computers...)

You know, if you warp into a sector a long way from the starbase you
can also use your hyperdrive to save energy. Point yourself at the
starbase, start the hyperdrive, but then abort before you actually
jump.

I think I'm going to have to go play some now too!

Hi Bob,

My web host has been down for a day or so now. Due to the way they
have things set up this means e-mail and DNS for my domain are also down.

It should be back up within a day or so, if not I will go hunting
for a new web host.

Steve

> the hang of this?

What Thomas said and it is position sensitive. That is, if you only have a
single space between the number and your code, it is a label. If you have
two spaces, it will be an assembly nemonic. Third is comments IIRC.

i.e.

```
10 LDA ;One space
Is a label LDA
10 LDA ;Two spaces
Is the asm instruction for LDA. You also have to give the assembler a place
to start assembling with a ~
1 .OPT OBJ
5 *=$680 ;Has to be $680 because MAC/DDT uses $600-$680
If you do something like
10 START
20 LDA #0 ;The # forces the 0 to be a number rather then an address
30 STA $6FF ;No #, so this will be interpreted as an address.
40 RTS
```

START will be equal to $680, so you can JMP or branch to it in your code. If
you are sticking with DDT, I think you want a to use a BRK vs. a RTS for
now.

You can also assign labels/variables in the code.

```
9 MYBYTE=$680
Then change line 30 to
30 STA MYBYTE
```

You also should use the .END directive at the end of your code. There's a
few other things, like learn how to assemble to disk, but that is the
getting started info you need.

Thomas,

I have your order here. Please e-mail me at atari@yahoo.com for more
details.

Thanks

Steve

All you guys are novices.

This is what you need to do.

Get a voice recoginition program, and map some voice commands to keys, like "Shields" "Tracking" "Hyper Warp" for hyperspace engage, "Map", "Warp 1" thru "Warp 9", "Stop" for engine 0 speed.

Then you'll be in Capt. Kirk heaven!

I should know :)

Message-ID: <vo6po58eii7b2b@corp.supernews.com>
Source record: 18851

Sorry Hias, (writeatr doesn't have good error reporting.)
The original poster seems to have disappeared.
I was unclear about just about everything about what
he was trying to do. He/she hasn't been back to enlighten us/me about the
whole topic.

I guess you did put some error reporting in writeatr.

I have extensive experience with using a PC drive to read or write Atari
disks, wrote my own transfer program to transfer files PC<->Atari before APE
and SIO2PC.
As far as I know, my program is the only one that will write a boot disk,
using only the PC, that will work about 1/2 the time on a double density
Atari drive.

I learned that a good double density disk for both PC and Atari use should
be formatted on the PC, and be totally blank before formatting ie. don't use
a DD disk that was previously formatted on an Atari.

My experience with PC reading and writing of Atari disks was that it was
about 75% able to do either, other times, errors occurred.

This is when I wrote crc16 programs for the PC and the Atari that would
check the integrity of a file transfer.
If the transfer got past my error checking for the read or write, I would
always check the crc16 value to be confident the file was ok.

But I ramble.

# 5539. SC1435 monitor and 130XE

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-08 02:01:05 UTC
From: Mark Bedingfield <mark@computercom.com.au>
Message-ID: <BdKgb.140709$bo1.6598@news-server.bigpond.net.au>
Source record: 18852

Well guys (cheesy grin), my little idea worked. I now have my 8bit Atari's working on an SC1435 monitor. The picture using chroma luma on the 130XE is fan bloody tastic. I have also tried my 64k, green power led, 600XL using chroma, luma as well, not as good as the 130XE but still great. Will put some piccys up soon.

Mark

# 5540. Wanted: 256-512k MIO

Newsgroup: comp.sys.atari.8bit

Will trade or purchase. If for sale, must be reasonably priced. If for trade, I have the following items I'll consider parting with:

1) IDE, SCSI, MFM, RLL hard drives. The SCSI drives work natively with BB & MIO
2) RTime-8 Cart(s)
3) Mac-65 w/disk & docs
4) Action w/disk & docs
5) US Doubled 1050 disk drive(s)
6) 512k 130XE with CSS ROM, Audio & Video mods (needs help)

Thanks for looking.

UPDATES SINCE PREVIOUS POSTING
2003.09.27 Sunmark - Colossus Chess 4.1, Commando
2003.09.27 Steven Tucker - MaxFlash 8Mbit Flash Cartridge
2003.09.14 Petr Stehlik, Atari800 1.3.1
2003.09.10 added Xport - AtariXLBox v3 port of Atari800 emulator for Xbox
2003.09.05 Thomas Richter, atari++ 1.28
2003.08.30 Mark Grebe update, Atari800MacX 1.5.0
2003.08.30 Komires update - EMUAPC DEMO 0.92 (Atari 8-bit emulator for PC)
2003.08.23 Ullrich von Bassewitz update - cc65 2.9.2
2003.08.17 Sunmark Products update - many new products
2003.08.15 Steven Tucker update (Ape/ProSys v2.0.6, MaxFlash 1Mb Flash Cart)
2003.08.15 Carsten Strotmann updated - Infoline for ACTION!
2003.08.15 Thomas Richter updated - atari++ 1.26

------------------------------

Subject: Introduction
```

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---------------------------------------------------------------
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!
--------------------
This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this

list, please do your part in keeping it useful for everyone!

---

Skip the voice software, just get members of your family to work the
keyboard and joystick while you sit behind them in a nice leather
chair barking orders while the game is being projected on the wall of
your family room. Of course it helps if they're also wearing matching
uniforms and call you 'Captain'.

Not that I've gone that far.....yet...

# 5544. Atari 800 Power Supply Question.

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-08 12:25:31 UTC
From: inf0rmer <paulspam@e1designspam.comspam>
Message-ID: <%mTgb.141659$bo1.77121@news-server.bigpond.net.au>
Source record: 18857

Hello,

I am looking at obtaining an Atari 800 (NTSC version). I have seen one for sale on ebay, but it does not come with a power supply.

My question is: I am in Australia and the power here is 240v. I would like to know what specs tha power supply is so that I can buy one from Tandy Electronics (Radio Shack in the USA) - does someone know?

I'm a little unsure as to if the power supply outputs DC or AC, what voltage and current.

Can anyone help?

Thanks,

Paul...

# 5546. Re: Taquart's "TIP" format

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-08 18:27:24 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F84570C.1A66FF50@students.uni-mainz.de>
Source record: 18859

Hello Bill,
well, HIP can have a resolution of 160 x 200 Pixel, RIP can have a
resolution of up to 160 x 238 Pixel and TIP can have a max. resolution
of 160 x 119 pixel. Concerning the colors, HIP has approx. 30 greyshades
(not 31 or 32, I don`t know why), RIP should have 16x9 colors
(Gr.9xGr.10) which would give 144 colors, but in practice you never see
more than 32-64 solors. TIP should have 256 colors.

Alas, TIP does not look pretty well on my PAL TV. To me it looks like
any other Gr. 9 + 11 graphics, except that it uses over + underscan
(like Technicolor does). Thus, one will see the higher resolution in
height (119 pixels instead of 96), but one cannot see the higher
resolution in width (160 pixels instead of 80) very good or precisely.
But maybe that depends on the computer and/ or the TV/monitor...

At least most Technicolor and Apac pix look much better than all the TIP
pix I have. But I guess this also has to do with the lazyness of the gfx
creators - they do not paint/draw the graphics any longer, they convert
it from a PC picture. In the past one could use an ST or Amiga picture
for that (with a max. resolution of 640 x 480), today they use PC
pictures with much bigger resolutions, which do not look good when
converted to the little atari...
-Andreas.

Hmmm,
I don`t have any paint programs for HIP and TIP - only converters. But I can give you dozens of paint programs for the Gr. 9+ 11 (256 color) mode. There is also a "Colorizer" program (named The Colorizer, by Bill Kendrick, I guess) to color Gr. 9 pictures and save them in Apac, Apac-2 or Pryzm mode... Just e-mail me and I will return Paint 256, The Colorizer and other Gr. 9+11 paint programs... greetings, Andreas.

P.S.: I also have paint programs for RGB and many polish graphics formats (INT, INP, XLP, MAX, etc.)...

# 5550. Re: Star Raiders (Warrior and Commander missions)

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-08 18:48:52 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F845C14.9897D74@students.uni-mainz.de>
Source record: 18863

Well,
seems you have some knowledge of Star Raiders (most ABBUC members
don`t), so I will ask the question here:

- what can you do when you lost your onboard computer (i.e. when its
been destroyed) ?!?

The question seems fairly simply at first, but wait: You have to search
a Starbase to repair it. But, without the onboard computer you will not
be able to find a starbase (in Warrior and Commander missions), since
the info for horizontal, vertical and +/- location are out of order
then. And as long as you cannot locate a starbase, you cannot repair
your onboard computer, right ?!?
(Looks like an endless loop to me...)

what makes this situation so worse, is that you also have some problems
in EXACTLY locating the Zylons (the first 2 Zylons will attack you
directly, the others won`t) and most of all you are still losing energy
(which can only be re-filled at a starbase)... In other words: When I
have lost my onboard computer, I am dying slowly (running out of energy,
unable to exactly locate enemies or star bases, etc.), but I am
dying... Any help, to solve this situation would be appreciated !!
greetings, Andreas.

That's a cool idea. Good luck if you can convince your family to do it
for you, though. ;^)

Seriously, though, I always imagined that you were a solitary pilot
in a small craft, rather than flying anything with any kind of crew. :)

Use your Long Range Scanner (L Key) to locate Starbases and enemy
ships. If your ship computer is destroyed, then your LR scanner will
always be available (it can be damaged, but will still be functional).
The game design is such that you can lose one or the other
(computer/scanner), but not both at the same time.

Yea, they wouldn't go for calling me Captain (I wanted them to do it even if we weren't playing the game). But I did hook up a laptop with Atari800win through an Infocus projector on a big wall, that was completely cool.

I agree though, I always imagined myself in a single seat fighter when playing.

Hi, Just wondering if there has been any new updates to this SpartaDOS compatable game dos. Now that I have a hard drive I find that I am doing more and more with SpartaDOS and slowly moving away from MyDos eventhough I think the Ataridos compatability requires MyDos.
My partitions are:
SpartaDos 33A- 65535 Sectors
SpartaDos 32d- 65535 Sectors
SpartaDos 32g- 65535 Sectors
MyDos 4.534- 65535 Sectors
And many about 150 partitions of 720 sectored program and Magazine disks
TIA
RoyE

No joke: My reasons for being an Atariphile were, in order

Seeing Starwars being played on a projection TV screen at Pacific Stereo in
Mt. View CA.

PacMan being run on an Atari 400 at Macy's.

Friends that worked for Atari

Atari being relatively local for me.

I think you may have to be a hold over from the hippie days to remember
Pacific Stereo. It was from the days where it was essential to spend at
least 2 months wages on a stereo system that would cause permanent hearing
loss and require a small pickup truck to relocate.

I still remember when I bought a Technics<SP?> turntable from them. The very
attractive hippie chick there had to call over another clerk to take my
money. When I asked why she said ~"I got in trouble for stealing so now they
won't let me handle money."

Depends on which upgrade you can find. I have done lots of Newell. Rambo is a little more supported by commecrial stuff. Best Electronics may still have Wizztronics. B&B may have rambo(don't kniow).

DIY can go to 4 megs. Some using Simms. I have no idea about compatibility with MIO for any of them.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

No Problem!

BTW: I couldn't resist being a litte bit ironic since your postings
are usually correct - I hope you didn't mind that.

> The original poster seems to have disappeared.
> I was unclear about just about everything about what
> he was trying to do. He/she hasn't been back to enlighten us/me about the
> whole topic.

ACK. A significant percentage (approximately one third) of the bugreports
I received for AtariDsk and WriteAtr so far could be tracked down to
be very simple mistakes, eg using HD floppy disks with the 1050,
mixing up enhanced density with double density, or just the user failing
to read the program documentation. OTOH, some users provided me with
really useful bugreports and helped me to resolve quite some problems
I could never have tested by myself (eg with special disk drives).

> I have extensive experience with using a PC drive to read or write Atari
> disks, wrote my own transfer program to transfer files PC<->Atari before APE
> and SIO2PC.
> As far as I know, my program is the only one that will write a boot disk,
> using only the PC, that will work about 1/2 the time on a double density
> Atari drive.

Which approach did you use for that? Did you programm the FDC directly,
or did you also use the PC BIOS calls (int 13h)?

AtariDsk and WriteAtr (which are based on the same low-level functions)
just install a new drive parameter table (located at address 0:78H)
and then use the standard BIOS calls to read/write/format the disk.

When I started playing with Atari disks in the PC back in the early 90s,
I tried to find out the correct gap values by trial-and-error. I could
have saved a lot of time (and frustration) if I already had the
datasheets of the 765 / 2793 FDCs...

BTW: At the very beginning (until I used some working gap-values) AtariDsk
didn't work reliable, too. Currently, I'm using the following parameters:

DD: format-gap = 20, write-gap = 10
ED: format-gap = 32, write-gap = 16
HD: format-gap = 10, write-gap = 6

(the HD format is used by the HDI, 36 sectors with 256 bytes on 80
tracks and two sides of a 1.44MB 3.5" floppy disk).

> I learned that a good double density disk for both PC and Atari use should
> be formatted on the PC, and be totally blank before formatting ie. don't use
> a DD disk that was previously formatted on an Atari.

I agree with the "good disk", but personally I never had problems with
disks previously formatted by the Atari. I used some 4 or 5 different
1.2MB (HD) drives in the PC and all of them were successful in
formatting & writing the floppy disks so that my (DD-capable) 1050s
could access them. But then, I don't have other Atari drives than
the 1050, maybe the XF551/Rana/Trak/... drives are more picky.

> My experience with PC reading and writing of Atari disks was that it was
> about 75% able to do either, other times, errors occurred.

Personally I never had problems with writing Atari disks in the PC,
but my PCs could not read disks formatted with my 1050s reliable. I
assume this is due to the index-hole issue, most ï¿œPD756 compatible
FDCs don't like to get an index-pulse within a sector and abort the
sector-read command. I'm not totally sure if this is the real cause
of the read problem but several tests indicate that it could be:
usually there's one sector on each track which cannot be read by
the PC (sometimes all sectors read in fine), and the PC has no problems
reading a disk which was formatted by the PC and then written by
the 1050.

If anyone has another (better) theory of what's happening exactly,
I'd really be glad to hear it!

so long,

Hias

Hello, Hias.
No problem about the comments you make.
You ask if I programmed the FDC directly or used
DOS interrupts. I used DOS interrupts.
Actually, what I did was modify Charles Marslett's
Myutil code for my use, I just used the read and write
sector code from Myutil.
I don't remember much about it, it has been years.
Seems there was a table of sectors for the 'interleave'.
You've gone much further into the 'headers', the way
the data on the disk is structured.
Mine was simple, I guess. I was pleased it worked at
all. I did try to modify my program to properly initialize
a 1.2 meg 5 1/4" disks to read and write DD.
That's about all I remember.
Regards

# 5575. VCS day 1!

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-12 05:20:44 UTC
From: bill@newbreedsoftware.com
Message-ID: <Mw5ib.30494$dk4.861071@typhoon.sonic.net>
Source record: 18888

Brief note about my first day at the Vintage Computer Show (VCS 6.0)!
I didn't get a chance to wander around at all, so I can't speak much about
the other exhibits yet...

My own presentation (Atari 800XL running various games and demos, and
Atari800 emulator running on a laptop, doing the same, but louder ;^) )
didn't gather hordes of people, but it definitely didn't get passed by too
much ;^) (Some older folks who seemed ONLY interested in much older, much
bigger iron, would glance over, and then keep walking after the saw what I
was about ;^) )

There were definitely some Atari fans there. I mention GTIA modes and DLIs,
and they knew what I was talking about. One fellow start conjecturing how he
thought certain effects were being done.

I think I may have made Atari800 (emu) users out of most of them, and possibly
sold some SIO2PC and APE cables, and even some AtariMax flash cartridges.
(You're welcome, Steve!) It's not like I was there to sell stuff, but people
were genuinely interested in the funny cable out the back of the Atari and into
the back of my laptop, for example...

(One fellow heard the Atari booting, and started craning his neck behind my
monitor... "You got a 1050 back there, or something?" "Yeah, right here!"
I said, patting my wife's laptop :^) )

Anyway, the person next to me (who came with a portable C=64, a Tomy Tutor
and a Tomy Pyuuter from Japan) won't be there tomorrow, so Bob Wooley, talk to
Sellam and see if you can bring a set of 1200XLs. Just be sure to bring
some power strips and monitors. ;)

Perhaps see someone else from around here tomorrow!

> Well, that is interesting! What are the connections?

Simple, I cheated ;-) I pulled the guts out of a Commodore 1084s and inserted it (with a little case modifaction) in a SC1435. While repairing one a while ago, I noticed that it was the same as Philips CM8833 mk2 and the Commodore 1084S. All three were built by Philips. So I just removed a 1084S board swapped the flyback transformers (the Commodores was faulty), and voila. The 130XE came up beautiful. Just nice to have an Atari Monitor on the desk instead of a Commondore one. I have taken a few shots of both a 130XE and a 600XL using chroma luma. I will put them on my web site soon.

> Which "mac" assembler are you using? Atari macro assembler? Oss mac/65?
Other?
> Something without macros such as the Atari Assembler Editor cartridge?

Ok, allow me to butt in here and show just how ignorant I am...

I have been writing programs in assembly for... UGH, longer than I care to count, but(!), the only things I ever used was the exceptionally crappy assembler program from Compute!'s"Machine Language For Beginners" and the Atari Assembler Editor cart.

I had extremely bad, repeat, BAD, experiences with the Atari Assembler cart at first. It was... almost 2 years before I learned about the errata sheets from Atari. After that, it was a breeze to use.

As for the program from the Compute! book, it was loaded with bugs that I spent close to six months ironing out. And after I found out what was up with the error laden user manual for the Atari cart, I decided the Compute! program was way too sluggish and, for lack of a better word, "stupid" for any serious programmer to waste time with.

Now, I recently stumbled across a copy of the Atari "Macro Assembler/Program & Text Editor" on E-bay for a whopping 5 bucks. I figured I'd dump 5 bucks into an original copy of Atari software, and I figured I may actually have a use for it. After careful examination, I am 90% sure that I am missing a manual. It has a manual with it that explains every last function of the program/text editor, but not so much as a mention of the Macro Assembler. If anyone out there has a copy of this manual or knows where I can find it online, you would be my official "cool guy of the decade". I tried to run some source code files through it from my assembler cart and got some really cryptic error messages. It is a very strange beast to me.

Anyways, allow me to explain something here. I cut my teeth on BASIC, and then went straight from that to assembly, and that was IT (that was an INSANE jump for me, I nearly pulled my hair out trying to figure out assembly). I never bothered with anything else. With that said, I now ask very sheepishly... What is a macro? I think it's just because I never used anything besides Atari's BASIC and assembler carts that I have no knowledge or understanding of them. From what I understand of it, I think a macro is a pseudo-command/statement that is actually a string of commands or statements, much like any normal subroutine, except the macro is defined at some point in the code and then the commands of that macro are automatically assembled into the object code any time there's a reference to the defined macro.

Like... (bear with me, this is only a guess...)

Say I want to move a string of data into low screen memory from page six or wherever using a macro... would I do something like this?

```
TEST (Define the name of the macro, in this case "TEST"?)
LDY #00
START LDA $0600,Y
BEQ EXIT (I always uses zeroes to mark the end of a string)
STA ($58),Y
INY
JMP START
EXIT RTS
```

And then, somewhere in my source code, I just make a reference to the macro by it's name or whatever and the macro is inserted into the object file?

Say...

```
[source code]
TEST
[more source code]
```

Am I right, close, or totally lost?

Sorry if I come across as a moron, but that's something that has puzzled me for years.

Thanks to anyone who can shed a little light on this.

Yup. Went "down the tubes" right behind Sir Clive. :-P

Face it. All of the 8-bit computers went down the tubes about a decade ago.
All of the 16-bitters followed closely behind. And most of us will see
todays 32-bit computers go down the tubes as well. Such happenings are
called technological progress.

We don't have to like it, but we do have to live with it.

Not necessarily. What we can do is try to bring a little of that old-style
machines charm to the new architectures.
64 bit power combined with 8 and 16 bit ease of use and control over the
machine is not that bad and it is at least feasible.

I found an Percom drive along with an Atari 800 at a garage sale the other day and read some posts about the drive itself. First the drive model is an AT88-S1PD and the drive is a SS/SD and I like to replace it with a 5.25 DS/DD drive (I may have one lying somewhere in the basement). I also read an older post about a Data Doubler card in which you have to slide into the PCB to get the DS/DD effect. Where exactly would one go onto the PCB board just in case one is already installed?

The AT88 series is single-density only without the 'data doubler' card, which plugs into one of the sockets on the PCB and makes it DD compatible. I believe this card plugged into the CPU socket like a Happy 1050 upgrade.

With a 3.5" mechanism you can store 360k per disk on 720k disks in AT88 mode. With a RFD series drive or a data-doubler installed, you can get the full 720k.

Steve

# 5584. Hi, Bob, new post.

Hi, Bob.
I don't think I've heard from you since I sent the e-mail that requests Mom, with you accompanying her, to come on Thursday 10/23/03. There's a circus on that Friday, and we have Mom a ticket. And Mom's first appointment at the Cole Vision Center, Dr. Lawder is for Thursday, 10/30/03 at 9:15 AM.

Eleanor and I will be going to Topeka, KS tomorrow, so I won't be able to respond to e-mails. We will confirm the date you can bring Mom. Eleanor and I will not be back in Cleveland until Monday 10/20/03.

Uhm... How can we do this.... We will be on the road most of 10/13 and 10/14, you could call the cell phone at 216-702-8437 during that time and probably get an answer. Normally, the phone stays in the car and there won't be anyone to answer it. I think there may be a voice-mail to leave messages, I'm not sure.

Love,
Russ

I tried a friends out about twenty years ago and was a little jealous. That was my pre-Atari period. The price tag was a little high then so I went with the Atari. Now that they're relatively cheap, I figured I'd get one. I've never seen a disk drive that was made by Fisher price before 8-). The computer itself is pretty rugged and works well, I just hate the disk drive. Something different to play with for a while, I still love my Atari though and I still check comp.sys.a.8 every night. I just wanted to come out with this before ya'll heard it from somewhere else 8-).

Yeah. I posted that at about 5 am this morning and wasn't paying much
attention. After I realised it, I was wondering how long it would be before
someone noticed it...

heh, your best bet, if it bothers you, is to log on to google and have it removed from their archive. You have have been using a valid email address in order to do that though.

Hello all! I've been using this excellent Atari 800 emulator, Atari800Win Plus 3.1, for some time now, but I can't seem to get the audio and video settings just right. Any of you long-time users of this emulator have any suggestions as to what the settings are for the best performance?

Not even close to a moron in my book, I also came up from crude
Basic skills and even very low level assembler from Timex 2068.
Never got the hang of Atari Basic but I can get around somewhat.
6502 assembler is a breeze after the Z80 but most of the learning
curve is as you've experianced, getting to know ones particular
assembler. Yes you are missing the AMAC manual, I know of no
online source, but B&C sold me my complete AMAC package for $40??
I am partial to the MAC 65 cartridge myself, but wanted to check
out the nice things I heard about AMAC personally. Basic
understanding of Macros and their use is right on. You define the
Macro first with a lable LIKE name. The Macro section ends with
.end Macro and when you want that particular snipet of code

inserted into the object file you place the Macro name as if it were a label into the source code. Each assembler tends to require different uses of punctuation, etc., and I don't even know those for my mac65 cart right at the moment anyway - but the gist of it all is there.

The mac65 manual is online
http://www7.brinkster.com/atari/mac65.htm#topofpage

and chasing down a broken link I see he has taken it upon himself to provide the basics for AMAC as well, good on him, with credit to Nick Kennedy.

I have a Timex Sinclair 1000 just gathering dust. Any idea where I can get some replacement RAM for it? It died on me about 3 years ago, but I still have it!

> Never got the hang of Atari Basic but I can get around somewhat.

I tackled Atari Basic at about 7 or 8 years old. At the time, my school was using Commodore 64s, 128s, and one Atari 130XE. They also had an Apple II and LOAD of hardware & software that had been confined to the storage closet that I tried to talk them out of for years. I finally succeeded in '92.

> 6502 assembler is a breeze after the Z80

A bit off the subject, but doesn't the Z80 have a good deal more registers than the 6502? Not that I'm complaining about the 6502, but I never screwed around with anything else. Right now I'm wading my way through Windows assembly.

but most of the learning
> curve is as you've experianced, getting to know ones particular
> assembler.

That's good to know. Considering the fact that my first Atari computer (800) is 2 years older than me, many people think it's really odd that I know anything at all about these "ancient" 8-bits. I was 4 years old when my 130XE hit the market. :) It's a very enjoyable and rewarding hobby for me, even though my wife thinks my stack of old 8-bitters is a complete waste of time, money, and space.

Yes you are missing the AMAC manual, I know of no
> online source, but B&C sold me my complete AMAC package for $40??

You paid 64 bucks for it??? That's a bit pricey, don't ya think? ;)

Anyways, I've got everything but the AMAC manual, even the original box.

> I am partial to the MAC 65 cartridge myself, but wanted to check
> out the nice things I heard about AMAC personally. Basic
> understanding of Macros and their use is right on.

Sweet. So I at least know that much about it. Now all I have to do is get a
manual and figure out the syntax of the damned thing.

You define the
> Macro first with a lable LIKE name. The Macro section ends with
> .end Macro and when you want that particular snipet of code
> inserted into the object file you place the Macro name as if it
> were a label into the source code. Each assembler tends to require
> different uses of punctuation, etc., and I don't even know those
> for my mac65 cart right at the moment anyway - but the gist of it
> all is there.

I would like to have a MAC65 cart, but I get the job done just fine with my
Atari assembler cart. Hell, I've been using it for over 10 years.

Get out. Just leave. It is too emotionally painful to have you around
now, to live with this betrayal.

Ahaha, just kidding! I think Atarians like the Apple II, there wasn't
as much rivalry there as with some of the others.

Maybe that's one reason why Atarians like the Apple II, but I can
think of a few others.

Have you ever tried to make a cursor go up one or more lines in the
Apple II screen editor?

Have you ever tried to make an Apple II sound like an Atari 8-bit?

Have you ever tried to program color in BASIC on an Apple II?

Don't get me wrong -- the Apple II had some major advantages over
other 8-bit machines, but in at least three areas, Atarians could feel
smug about their computers when comparing the two.

Take care.

Oh yeh, I shut down everything! Well, I found the starbase, got it in sight, and then yeh, turned off everything I could.

That is one thing I LOVED about Star Raiders that even the most recent Battlesphere did not quite capture in their Jaguar rendition...

You have limited energy. And everything on the ship can be adjusted to make sure you use energy as slow or as fast as you want. Kinda like a home electric bill. :)

Of course there is always that life support you can't turn off, so you will always have the trickle of energy pulsing by, but you can get it to where you use energy vvvvvveeeeerrrryyyyyy sssssllllllooooowwwwlllyyyy....

Awesome! I need to get some use out of my Atari ST color monitor so this is
great news.

On a similar note I would be willing to trade my Atari 800 XL with Rambo
256K (and a few switches for various operating systems for a 256K + ram board
for the Atari 800.

(If you have a 80 column card I would consider that too).

Thanks!

Clu

I used to do this with my friend. Both playing Star Raiders and Star Raiders ][. My friend, or sister, depending, would operate the keyboard and I pilot, or visa versa. So much fun.

Or have you set up a little area to be the cockpit of Star Cruiser 7? I did that once. Setup a small room (a closet actually) to be the cockpit. Close the door to keep out all distraction. Set up a flight stick, and used the Atari 400 with it's keyboard.

Say.... I think I should build something more permanent now. Make a wood mockup, complete with built in keyboard, controls ... oh yeh...

# 5607. Atarian photos from Vintage Computer Show!

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-14 00:18:02 UTC
From: bill@newbreedsoftware.com
Message-ID: <_gHib.31646$dk4.870107@typhoon.sonic.net>
Source record: 18765
Cross-posted to: comp.sys.atari.8bit,rec.games.video.atari

I exhibited at this weekend's Vintage Computer Show (VCS 6.0) in
Mountain View, California.

I displayed the following:

Atari 800XL + 256K + PAL ANTIC
Atari800 1.3.1 (X11 target) running under Linux
AtariSIO (SIO2PC/APE clone) under Linux
AtariMax Flash cart (the one with Gem Drop on it that Steve gave me)

On Sunday, Bob Woolley and Ben Corr showed up, and Bob brought:

Atari 1200XL booting off of a Compact Flash memory card
Atari 1200XL with 256K battery-backed up RAM, and with stock mem chips
removed (so when he does an IDE upgrade, it'll still run off stock power)

Sadly, I didn't win any awards, but then again, that's not why I was there.
And as I said on my 'photos' page, aside from the teletype which went off
occasionally, I probably had the loudest display there. ;^)

Here are the photos!

http://www.newbreedsoftware.com/bill/photos/vcs60/

Enjoy!

Could see both actually. In the comic book it was a solitary craft.
Remember in Atari Force and the Star Raiders Graphic novel?

Then of course Star Trek II the Wrath of Khan was out a few years after
this game out. Seeing the viewscreen and how the ship handled, at least then
fired up the imagination about a whole crew aboard Cruiser 7.

Do you mean when you're typing in BASIC? Use the ESCape key to turn your cursor into a 'ghost' cursor (one which can move all over the screen in any direction yet does not enter any data it crosses until you hit the ESCape key again and return it to edit cursor).

This allows you to travel upscreen to any line and enter just the parts you want to enter by pressing the ESCape key to control just what you want to enter. I've written whole programs with just a few lines where data is repeated by zipping up and down to various spots and entering only the parts I want by using the ESCape key.

In article <REhib.8470$843.1181@nwrddc03.gnilink.net>, samgillett@msn.com says...

>Face it. All of the 8-bit computers went down the tubes about a decade ago.
>All of the 16-bitters followed closely behind. And most of us will see
>todays 32-bit computers go down the tubes as well. Such happenings are
>called technological progress.

Its kinda obvious the 8-bits and the 16-bits are gone. I bought my first Atari 400 in 1982. I dragged my 832K Atari 800 XL to a CompuFest in '90 raised some eyebrows. The commie who had his computer setup next to mine shut his off and went away.

I had my Amiga 2000/GVP3001 28 Mhz 68030/68882 5 meg RAM machine at the '91 Fest. (along with a Mega ST2 16 Mhz Fast Technologies accelerator with the JRI 4K palette).

Which has nothing at all to do with why or how Smilin' Jack "stole" commie engineers. The ST was not that well designed machine (it was thrown together in something like 6-9 months, and it showed).

Now I'm using an Athlon 21oo, 512 meg RAM, with a 128 meg Radeon 9ooo. Its starting to show its age.

http://www.jdr.com might have some but I wouldn't know the chip number
off the top of my head. Also http://www.jameco.com most didn't know
that the 2068 was a full 64k machine, only thing really lacking with
it was disk drives. But I got the whole deal for $120 just as Timex
pulled out of the 'computer' market as IBM had just stepped into the
PeeCee market.

> A bit off the subject, but doesn't the Z80 have a good deal more registers
> than the 6502? Not that I'm complaining about the 6502, but I never screwed
> around with anything else. Right now I'm wading my way through Windows
> assembly.

IIRC 3 16 bit registers with a duplicate set of all registers
available with a 'flip' OP code. Plus the standard accumulator, index
etc. The sweetest thing about the 6502 is it's simplicity, that's
how come we got 16 DOSes to choose from and assemblers in basic even,
in my opinion the best processor to learn assembler on because one
has to mind his p's and q's in order to get anything done with just
A, X, Y, and the flags.

>
> You paid 64 bucks for it??? That's a bit pricey, don't ya think? ;)

No, $40 and yes it was pricey but I had order other stuff so shipping
wasn't a full part of the price.

>
> Sweet. So I at least know that much about it. Now all I have to do is get a
> manual and figure out the syntax of the damned thing.
>

Exactly why I went for the $40 as I wanted the full AMAC experiance, I
thought I was missing out on something Mac65 couldn't do - I was wrong.
I've spent worse money than supporting my friendly Atari dealer, I
swear.

>
> I would like to have a MAC65 cart, but I get the job done just fine with my
> Atari assembler cart. Hell, I've been using it for over 10 years.

Time will come when you change your tune, I would almost place a bet
on it. Years ago I knew a guy that did all his coding on the fly
using the debug part of EdAsm cart, he didn't even know how to do
source code and thus no saving of source code. He just loaded the
executable into memory and debugged it from start to finish. Very
extensive code too, I could not get him to understand how easy
the source code part was or how much more flexible so he never
tried to learn different. Still doing it that way that I know of.

# 5615. Light Pen/Gun question

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-14 10:27:18 UTC
From: The Undead Mechanic <davidb81@earthlink.net>
Message-ID: <acQib.617$7a4.250@newsread4.news.pas.earthlink.net>
Source record: 18778

Earlier today I went rooting about my vast collection of old floppies and I found one of my long-forgotten projects that, at the time, seemed like a killer idea. Until I hit a serious snag, that is...

Several years ago I decided to create my own strange little DUP program that used a light pen driven menu. I didn't get far. I discovered reading the light pen required a lot of math. After getting inventive with the math to figure out what values at $234 and $235 corresponded to the actual columns and rows in Graphics mode 0 (that sucked!), I never figured out how to read the values when the pen tip/trigger was pressed. According to "Mapping the Atari", the values are "pulled low". Sure enough, they are, but for only a fraction of a second.

This totally screwed up my desire to write my own custom DUP package.
I was hoping that I could get it to the level of precise control that is seen in "Atari Graphics". Alas, I never did.

I dug it out today and played around with it a bit more and decided to try the gun instead of the pen. While the idea of pulling out a Buck Rodgers style weapon and blasting away at my menu selection isn't what I had in mind, I learned something. I get the exact same values out of $234/$235 with the gun when I aim at stuff, but there's no change when I pull the trigger. I ran a check on the value of $284 and the trigger doesn't affect the fire button at all.

I dug out "Bug Hunt" and blasted my way to C.E.O. just to prove to myself the gun wasn't dead.

So, a beseech thee, mighty Atarians! Is there any other way to read the light pen trigger? How about "What is the correct way to read the light pen trigger?".

If I can get over this hurdle, my DUP should be up and running in no time.

Thanks,
--

Light pen/gun trigger is one of the direction switches for the joystick. the
light pen uses the trigger line to tell antic when the light beam has passed
in front of it.I did a small routine years ago that had a cross hair
following the light pen around. Had to have offsets, wrap arounds to get it
following the light pen.

## 5622. RIP/TIP-like modes with DLI color changes?

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-14 22:39:26 UTC
From: bill@newbreedsoftware.com
Message-ID: <yW_ib.31978$dk4.876902@typhoon.sonic.net>
Source record: 18787

I keep thinking that it'd be cool to come up with a graphics mode
that allows DLI palette changes throughout the image, so that each scan
line will be the _best_ representation of the colors from an original
image (say, a JPEG photo).

APAC, ColorView, RIP and TIP all provide a more generalized display,
where any of the possible colors can show pretty much anywhere on the screen.

Imagine instead, picking the best N colors for each scan line. A photo
of a blue sky and a green field could look much closer on the Atari if
the top part of the screen was all blues and whites, and the bottom was
all greens.

I've been thinking of various modes like HIP, RIP and TIP, though I'm not
sure they'd look any good.

For example:

Frame 1: GRAPHICS 9 (80x192x16 shade) (greens)
Frame 2: GRAPHICS 10 (80x192x9 palette)
(reds, blues and combos)

Or:

Frame 1: GRAPHICS 9 (80x192x16 shade) (greys)
Frame 2: GRAPHICS 15 (160x192x4 palette)
(whichever 4 colors work best for the scanline)

... stuff like that. :^)

some time ago (about 8 years) i wrote a game with light gun support..
The trigger in the gun, is equivalent to "stick up" when it's not pressed,
and goes to center (or... no activity in the stick) when you push the
trigger...

Hope that helps...

I remember the light pen. At least, I remember the port that was made for it. I looked forward to Atari creating lots of things that could use the light pen, seemed like the wave of the future. Sort of like the mouse is today, yet before it's time. As usual, I was disappointed again.

btw, the stock reports for Time Warner for 1979 - 1984 just came in (minus 1981). It is on microfiche though, so I won't be able to view it until I get to the Library. They did GIVE it to me though, I didn't have to check it out or anything, so it is part of my permanent collection. Only hope I can find a place for it so that I do not end up losing it.

# 5626. FS : Boxed+new ATARI XEGS carts $5 each

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-15 07:49:55 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0310142349.14b8764d@posting.google.com>
Source record: 18789

Hi,

we offer these carts for $5 each , they are boxed & new :

Archon
Ballblazer
Crossbow
Davidï¿½s Midnight Magic
Gato
Final Legacy
Hardball
Joust
Millipede
One on One
Star Raiders 2
Tennis
Thunderfox

These carts are boxed+new with English instructions and all these
games are
NTSC version (but also work on PAL systems).

We also offer these games on cartridridges :

Airball $8
Crime Buster $7
Lode Runner $7
Rescue on Fractalus $8
Robotron 2084 $7

Shipping :

I can ship worldwide :

Shipping 1 game is $7 surface mail or $9 air mail
shipping up to 15 games is $14 as a package ($33 as air mail).

I can accept paypal or money orders or cash.

You may also check my ebay auctions :

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&
sort=3&page=1&rows=25&since=-1&showpics=1&stab=0

> image (say, a JPEG photo).

> Imagine instead, picking the best N colors for each scan line. A photo
> of a blue sky and a green field could look much closer on the Atari if
> the top part of the screen was all blues and whites, and the bottom was
> all greens.

The problem is here to find an "optimal" solution for a given image.
You can of course pick DLI positions and colors by hand, but doing that
for an image at hand is quite some work. I remember a drawing program
("Fun With Art" ?) that allowed placing of DLIs at rather arbitrary
positions to bring more color to images, but this was also hand-driven
and by no means automatic. I've also a self-written (very, very very old)
drawing program at home that would do that on a Gr.15/Antic E screen with
an additional "drawing editor", but that was all but comfortable.

Another problem is the number of color registers that can be loaded in
an Antic E/F DLI. IIRC, the best you could do (with some nasty tricks as
avoiding a STA WSYNC) was about two to three color registers in a scan line;
if you want to load more colors, the end of the DLI of the current scanline
will get interrupted already by the DLI in the next scanline and you're in
a mess. This complicates the color arbitration even more since you cannot
just switch from Gr.9 to Gr.10 "at once".

So long,
Thomas

From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F8D9A12.C770D2F6@students.uni-mainz.de>
Source record: 18794

Hmmm,
I already had the same idea. But after the onboard computer had been destroyed, the long range scanner did not show anything - just a blank/black background and nothing more (no ships, stars, starbases, etc. just a blank/black background - even when I was moving around I could only see "nothing")...

Maybe my cart has a defect - I already had half a dozen of defective Star Raiders carts. Maybe this had to do with XL/XE incompatibility (I merely have XL and XE computers) or PAL incompatibility (I live in Germany = PAL country) or bad copy protection ? But these defective carts showed garbage, whenever you tried to use the galactic map...

Now I have a Star Raiders cart, which seems to work alright (no garbage appears, when you call the [G]alactic map) - but I have not figured out yet, how to solve the problem with a destroyed onboard computer. To me it seems, like the long range scanner is also dead, when your computer is dead... And thats an
unsolv(e)able problem for me... I always had to end the game, when this happened... greetings, Andreas Magenheimer.

Source record: 18795

Er well,
for MyDOS there is a new version of MyPicoDOS (Version 3.0 or 3.1) from Hiassoft, Mathias reichl. It now supports 720 to 65535 sectors in single (128 bytes per sector) or double (256 bytes per sector). it also supports ultraspeed for any ultraspeed equipped drives and up to 8 floppy drives or harddisk partitions. Besides MyDOs, this gamedos also supports DOs 2.0s, DOS 2.0d and DOS 2.5 densities. the right gamedos for every DOs 2.x user.

hmm, spartaDOs - since I almost never use it, I have to takea look, which was the newest version of MSDOS and MSINI. I think there was a version 2.3 (and maybe more versions), but I never cared much about it, since I did not use sparta DOs... greetings, Andreas Magenheimer.

RoyE schrieb:

Message-ID: <3F8DA04E.15E70F50@students.uni-mainz.de>
Source record: 18796

Er well,
a game with lightgun support - what game ?!? Can it be had for download somewhere ?!? I remember playing all lightgun carts (bug hunt, crossbow, barnyard blaster, crime buster) also with a lightpen. The direction movement worked (but the lightpen was not as accurate as the lightgun), however the lightpen trigger acted inverse to the lightgun trigger.

meaning, when you pressed the lightgun trigger you got one single shot (otherwise no shot); when you did *not* press the lightpen trigger you got auto-fire, if you pressed the lightpen trigger, the shooting stopped.

Thus the lightpen was good for playing games with "endless" ammunition, like Crossbow, not so good for games that counted and rated every single shot (like all other lightgun carts)... greetings, Andreas magenheimer.

P.S.: think I have some basic demonstration programs for the lightpen and some action demonstration programs for the lightgun, maybe they can help you...
(e-mail me, if interested).

Jeez. No wonder I never got anywhere with it. None of my manuals ever makes
a reference to the trigger button being a joystick direction value. The only
thing my books say about the Light Pen is that when the trigger/tip is
pressed, the value is "pulled low".

>

I wrote many simple and demo games years ago...
And many of them died with those weak 5 1/4 floppies :o(

Don't know if it is still there... I'm going to search (first i've got to
bring the disks, cause they are on my birth city...)
If any luck, i'll post where to download

Yup
I had the same trouble... i read a lot of manuals, magazines, etc!
And no info about it... So, i take my tools, and open the damn gun.. follow the wires, and voila! Joystick UP = Trigger..

Now i'm playing with that gun again, but it doesn't work on my monitor... (a viewsonic e17f)
It sounds weird, but i dont have a television, so i just connect the ataris to video input on my video card ;o)

Well... enough of myself
Be Well !!!!
:D

Well, NetPBM tools, GCC and Linux are free, so I was going to use them. ;)
My 450MHz Celeron could probably handle it for Wx192 images. ;)

Ah, interesting.

Thx!

Did you ever put them up on public domain? Holme's included a whole bunch of public domain stuff on those CDs that he gave me. It might be on one of those.

Actually, the Green (GR9), Red/Blue (GR10) would only need one palette
change per scanline. Change background from dark green (to tint GR9) to
black (or white, or one of the Red/Blue combo colors, I guess)

Still thinking about this ;)

Hmm, good point actually. You'd only need to change COLBK, and GPRIOR
in a scanline, and *that* is easy. Finding an optimal palette is of course
another issue.

So long,
Thomas

Well that is strange, I've been playing the game since 1981 and have
never had that happen. The design of the game is such that you always
have some way to keep on playing, for example your warp drive is never
destroyed. I've never had to quit a game of Star Raiders because I
was stuck somewhere and couldn't navigate or somehow find my way to a
Starbase.

As far as I am aware, the only value to tell A PAL from a NTSC machine is in
GTIA. Maybe swap that one as well and see what you get

James

Thanks to that glorious bit of info, my project is underway once again.

A bit unrelated, but I thought I'd have a slight problem figuring out how to do the row/column calculations for the light pen in assembly. Aside from one self modifying code screw-up, it was far easier than I was expecting.

Again, thanks a lot!

I, too, am in a similar situation. I do, however, have several TVs, but I have one room set aside for myself which has nothing but computers (tons of 8-bits, a 1040 ST, and one modern day puter), and a bookshelf loaded with manuals and old Antic & Compute books and magazines. My wife learned really quickly not to waltz up in here and start cleaning shit up. She did it once and I couldn't find anything for a week. And since she likes to hog the entertainment system to watch her programs (stuff that's so boring I can feel my IQ dropping), I got a second sattelite reciever and jacked it into my video capture/tuner card, and there is peace in my household yet again.

# 5645. manual or walkthrough for draconus

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-16 11:59:01 UTC
From: louis <lvaneijk@cistron.REMOVEandreplace>
Message-ID: <3f8e8d80$0$2737$1b62eedf@news.euronet.nl>
Source record: 18808

Hi All,

Since there is a Atari 8bit emulator for the Ipaq i'm playing Draconus
again!
Great game, but i'm stuck.

Where can I find the manual or walkthrough or any hints?

Somewhere in the games I see at different location an item which
turnsaround, but I can't take it.
Now I'm at the beast which I can't kill, so I'm wondering if those items has
anything to do with it....

Good to be back at my 8bit!

gtx

> As far as I am aware, the only value to tell A PAL from a NTSC machine is in
> GTIA. Maybe swap that one as well and see what you get

Absolutey correct, GTIA keeps the PAL/NTSC register and the Os rom reads it
from there. However, besides the GTIA PAL and NTSC machines differ in other
aspects. For example, on PAL machines an additional oscillator of 5/4 of the
main frequency is present to generate the color frequencies needed to drive
GTIA. There is no such circuit in NTSC Ataris. Besides, this factor of 5/4 is
also the reason why you don't get "artifacted colors" on PAL machines (or,
at least, not very good ones.)

So long,
Thomas

From: Bruce <No-Spam@Ivn.cl>
Message-ID: <bmm6c8$trj$1@news1.nivel5.cl>
Source record: 18813

to kill the final beast...
you have to find the "Staff of Findol" and got at least one of those bright
points floating.
Then you will be able to shoot those bright points when you're jumping
(jump.. press trigger)
when you got 1 bright point, the shot is a rect line , and the 2nd is zig-zag
, or viceversa

ok... when you get to the beast, stay at the start of the screen, and shoot
those thing to the head of the beast... it takes some time.. but it will
works..

Another way to make it really easy.. (it's a king of cheat.. dont know if it
is documented.. but i discovered myself those years)
is to get "invulnerable"... How ? easy...
Go to a mark of the sword "blabla" (the point where you can turn into
draconewt) with some enemies on top of it... and do the following..
Wait until almost all your energy is lost, and just before you die, go to
draconewt. (i do this waiting the enemy touches me, and then i go to
draconewt) the draconus will die (head blow!) but the draconewt will be
fine.
Then you will be invencible..... ( except if you get any especial item.. )

If you didnt understood a word ... i can post a video ;o)
Sorry for the poor english

## 5652. Beware of these trolls

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-16 18:45:17 UTC
From: mastertrollhunter@yahoo.com
Message-ID: <c82725e2.0310161045.6e4f5dd1@posting.google.com>
Source record: 18815
Cross-posted to: comp.sys.atari.8bit,comp.sys.sinclair,comp.sys.cbm

These posters are obvious trolls, most names are anagrams of something
containing the word "troll".

Donï¿½t react to the posts of this guy, itï¿½s the same troll over and
over :

Reltih Floda (Adolf Hitler backwards) raupico@yahoo.com
Tom R. Rastell (anagram of Master Troll) eneg_doowtrop@yahoo.com
Peter Mollror (anagram of Troll Emperor) pellus_torr@yahoo.com
(anagram of Super Troll)

Carl Philtmoon (anagram of Troll Champion) masheg_solea@yahoo.com.hk
(anagram of Mega Asshole)

Tim Spujum (anagram of Shit Troll shifted 1 letter up)
sluggosnake@yahoo.co.nz

other obvious trolls are

Lord Teviolus (anagram of Devious Troll) darmzunge@yahoo.de
Adolf Hitler jr. , llortagem@yahoo.ca (Megatroll backwards)
llortagig@freenet.de (Gigatroll backwards)

and

Zothen Runecaster (zothen@my-deja.com) , a long-time troll who fools
people since years with non-existing projects.

R.Ranlirpa (rranlirpa@freenet.de) "Aprilnarr" backward.Only posts
April the 1st.Various incarnations, always anagrams of something with
"April" and "Fool" in different languages.

My advice : Donï¿½t feed this silly kid and check names for anagrams.If
a suspicious new poster appears, check the name first.Two "ll" an "r"
, a "t" and an "o" make "troll" , he got better , so he may shift them
or encode it otherwise.Should be no problem for experienced
computer-fans.

# 5656. In search of a basic program

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-16 23:09:29 UTC
From: Randy T <nospam@diespammer.net>
Message-ID: <JyFjb.2082$wj.1789@twister.austin.rr.com>
Source record: 18819

I wrote a horse racing program in basic on my Atari 400 with a cassette deck on it 20+ years ago. I put it in public domain on the local BBS's. I was hoping that it survived for nostalgia purposes. I am not sure what the file was named. It was a 16k program and had 4 horses and some music and sound effects. You started with $1000 dollars to bet with. I was going to submit it to Atari but when they sent me the packet to do so, I found out that I might have a problem with copyrights on the music (The theme that plays at the horse races). So, I was to lazy to pursue it further. I was pretty proud of it as I wrote it before I ever saw similar commercial programs. If anyone knows where I might find this, please let me know. I found a couple of basic horse racing programs that were not mine in my quest.

I have also owned a couple of 800s and an ST before I moved on to the IBM compatible PCs. I am currently running an emulator on my Ipaq and have been having a ball with it.

Thanks,
Randy

# 5658. Another basic program

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-17 03:03:39 UTC
From: Docrotcod <rahbart@cox.net>
Message-ID: <i%Ijb.29$5c2.19@okepread03>
Source record: 18821

In light of the recent post looking for a basic program, I am looking for one of my favs. Actually two.

The first one was a demo pitting a Fuji symbol against a Commodore symbol. They are trash talking and whatnot and what finally blows up the c64 is a simple addition problem.

The second one is a game written in basic called dueling cannons. That was alot of fun.

Any help is appreciated.

Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

What did you do to add the Comp ports on the monitor? The Commodore 1084
model has those already installed.

I have the same monitor hooked up to my Falcon030 and would love to hook up
my 130XE to it also!

Tim

Beware of anyone who posts as "Mr. Mojo Risin'", he's Jim Morrison
returned from the grave! :)

Didn't we of c.s.s. do a thread about anagrams a couple of years back?
[Of course we did, you twit, you're the one who started it! -- Ed]

Look at :

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=1&rows=25&since=-1&showpics=1&stab=0

many games for $4 or $5 , all games boxed and new , NTSC versions with
English instructions.

You may also ask for a list , lots of games for $5 only.

Mathias

Or my brother :-) (He's tagged quite a few places -My speccy included-
with that)
Of course if James Douglas M. (aka Jim aka Mr. Mojo) were still alive he'd
probably use as Spectrum ;-) (So posting in c.s.s wouldn't be much of a
problem)

In any case I have it on good authority (You're insane - Ed.) that the
reason he overdosed is that he heard rumors about the CBM PET. That's
enough to kill yourself by eating curry let alone heroin ;-)

I literaly ripped the circuit board out of the 1084s and inserted it in the
SC1435. I had to drill holes in the back of the case to accomodate the new
plugs. I also cut out a small section on the front panel for the colour pot
as well. Although you could probable remove this if you wanted.

# 5673. Update to 1050 disk drive problem

Newsgroup: comp.sys.atari.8bit

From: frankodragon1@yahoo.com
Message-ID: <d50c8e14.0310171523.4dc57f3f@posting.google.com>
Source record: 18836

I just received my order for a tandon belt drive for my 1050 hoping it was the cure but I think I did more harm than good to the new belt itself (UGH!). Problem was the 1050 drive wouldn't spin with a disk inside it. So I ordered a new tandon belt. And without using any brains, I stretched it onto the smaller spindle and that's when I knew I think I ruined it. It still won't turn with a disk inside it.

I even tried sticking some copy-protect tape under the plastic flap where the drive spindle rests but that didn't work either.

Does anyone know if the belt has to be -tight- around the disk spindle and the smaller one? Seems like the new belt is just as loose as the old one? If so I'll just have to buy another one (Double Ugh!).

Did you check the pulleys to see if they spin freely? There should not be
that much 'tight',just enough to keep the belt on the wheels. Too much could
burn out bearings and/or motors. If it is not spinning at all, it may be a
circuit problem.
Mo

# 5677. JpegView 0.9 and PgmView 0.1 released

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-18 13:06:16 UTC
From: rjespino@hotmail.com
Message-ID: <9ee50737.0310180506.17344e9c@posting.google.com>
Source record: 18840

This has been a long time in coming (again!), but version 0.9 of
JpegView is now available:
http://a8jdpeg.atari.org
http://a8jdpeg.webhop.org

We've now got a PGM viewer too: PgmView, available at the same place.
See 2nd half of this message for more info.

JpegView is a JPEG viewer for the Atari 8-bits, based on the C=64's
Juddpeg decoder (http://www.ffd2.com/fridge/) written by Stephen L.
Judd.

The following changes have been made to JpegView:
* Improved graphics mode selection menu
* Improved support for large images, images up to 1280x800 will be
reduced to fit the available screen size
* Dithering added to all modes
* Improved GR.8 flicker mode
* Added horizontal divide by 4 capability
* Images are automatically adjusted so they no longer look stretched
in certain modes
* Assorted bug fixes and improvements

It may not seem like it, but there's a lot of new code in this
version, so there's probably some new bugs too. Please try this and
let me know if you have any problems.

--

There's also a PGM viewer now: PgmView

Decoding a PGM image is a lot quicker than a JPEG, but PGMs use more
disk space. Both a8jdpeg and JpegView will convert JPEGs to PGM, which
can then be viewed with PgmView. This is useful if:

* You want to view an image repeatedly (maybe in several display
modes), especially if you've got a big enough ramdisk.
* You've got a 48K machine and want to view images in HIP and the
other 64K modes (PgmView will never use more than 48K)
* You don't care about disk space

If you want to view the same image more than once, then you can
convert it to
PGM first and then view it with PgmView. This will work even better if
you've got a big enough ramdisk or a fast disk drive.

PgmView can use all display modes in 48K. People with 48K machines can now view images in modes that need a 64K machine with JpegView. Use JpegView/a8jdpeg to convert the images to PGM and then PgmView to view the images in HIP and other flicker modes that needed 64K.

PgmView also provides another way of transfering images from a PC to the Atari. You can easily convert from just about any image format out there to PGM using the freely available Netpbm toolkit (http://download.sourceforge.net/netpbm/), transfer them to the Atari, and use PgmView to view them and convert them to Micropainter and HIP formats.

As usual, comments, suggestions, bug reports, feedback, etc. are welcome.

Next up: A colour version of the JPEG viewer.

The Wiki at http://www.strotmann.de/twiki/bin/view/APG/WebHome
is not complete, but you can find some information there.

Maybe you find some time to contibute missing pieces.

Best regards

Carsten Strotmann

Source record: 18845

Got an update to the Percom issue: Took apart an old Amstrad PC with
5.25 floppy drives and used one as the replacement drive although it
reads DD disks it will only write SD. Also looked at the back of the
unit and I noticed one of the pins located on the card that sticks out
where you would connect a data cable to another floppy drive is
supposedly been cut off. Is this normal of AT88 drives? Or should
there be all 34?

One more thing- If I connect another 5.25 drive, say the other one
from the Amstrad, I have to remove the termination chip. That's the
IC-looking device isn't it?

> The AT88 series is single-density only without the 'data doubler' card, which
> plugs into one of the sockets on the PCB and makes it DD compatible. I believe

I was beginning to wonder myself if version 0.9 was going to ever get finished. I thought it was about finished in April, I've been fixing bugs in it since then! (finding the bugs was easy, fixing them was a bit harder). I'm hoping this version will have the fewest bugs so far, but I'm not putting any money on it.

> When do you have a color version for beta test ? :-)

Erm... best I can say is "soon" but in this context "soon" might be a couple of months or more. =)

I'm going to be reusing as much code from version 0.9 as possible, so any bugs found there, especially with large images, will help with the colour version too.

No, so long as you keep those activities restricted to the privacy of your
own bedroom.

Hmm Turbo-basic was fast but didn't have a good compiler. I didn't compile to real machine code and needed a very big runtime file this was a problem I think.

When the compiler could output a real assembler listing it would have been very populair...

Did the webpage itself appear, or did both webpages fail completely?
They are separate sites (tripod/angelfire), but ultimately they are
hosted by the same company (Lycos) so I guess there's a chance they
could both go offline together.

Just double checked and both sites work for me now. The link is not as
obvious at it should be though, maybe I need to redesign the page
some. JpegView is the second row in the table, click on "executable"
to the right of that. PgmView is on a separate page, there are several
links to PGM on the JpegView page that will take you there.

# 5695. Problem with old ATARI 800 XL

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-20 21:32:31 UTC
From: rinaldus_drybone@lycos.de

Source record: 18708

Found this old machine on a flea-market, but doesnï¿½t work correctly :

The computer runs and crashes sometimes after 30 minutes, sometimes
after several hours.Switching off doesnï¿½t help.

It does work again after a few hours.

Another problem : Sprites are too big in some games,when you boot
them.After a reset, they will be ok.

I think one chip may be defective and overheat.Itï¿½s an ATARI 800 XL
with an older board and socketed chips.

Anyone knows this problem ?

These days those kinds of stories are the stuff of Urban Myth. With progress the way it is just about all of the old warehouses in Houston and Dallas have either been torn down or converted into loft apartments. I'm sure the situation is 100 times worse in Silicon valley where real estate is worth it's weight in platinum. There are a few old warehouses left standing here in Houston, but they're so delapitated, and dirty, and full of holes it's hard to imagine anything useful left in them.

There were alot more and just about every eighties title was released with an Atari version. SSI bought out Avalon Hill in the nineties and carried on their tradition of multiplatform software.
Check out this link to the underdogs, it's like one of the best game encyclopedia's available on the net!
http://www.the-underdogs.org/

You'll find the history of all of the companies there as well as the platforms each game was released for.

condition would be worth?

# 5701. Technically best games on the ATARI 800 XL?

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-20 23:44:21 UTC
From: exxokaprulle@yahoo.com
Message-ID: <c30b2125.0310201544.6097bf41@posting.google.com>
Source record: 18713

Hi,

I want to build some sort of 8 Bit museum and I need some games for each system which show what these systems can do.

Can anyone tell me which ATARI 800 (XL) games really show what an ATARI 8 Bit can which are not 1:1 ported from an Apple II like many games?

Iï¿½ve heard the Lucasfilm Games should be best on the ATARI?

Stan

## 5702. 2nd question:Which hardware is available ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-20 23:53:05 UTC

Message-ID: <c30b2125.0310201553.7c2393c5@posting.google.com>
Source record: 18714

for the 8 Bit ?

I know there are different computer models , 800 XL , ATARI 800 and
different floppy-drives like the 810 and the 1050.

Can anyone tell me the most important 8 Bit hardware from ATARI, which
isnï¿½t too expensive for a small 8-Bit museum ?

Stan

It looks very advanced, is supposed to be fully playable, and is
getting good early reviews at atariage.com. I didn't read anything
about bugginess and I think it is okay.

Be sure to review it for us here if you buy it!

>But it seems that Turbo BASIC was not too common outside of Europe. <

It was not uncommon in the U.S., but there were several factors that (IMO) reduced it popularity here.

1) The A8 was seriously on its way down in popularity when TB got here (with English Docs).

2) OSS/ICD had sold quite a few BXL & BXE bank-switching "Supercarts" here for programmers/users who wanted something more than Atari Basic.

3) TB requires "ram-under-rom" space, so Sparta Dos users had to make a choice. (Resolved many years later).

4) Pretty slow loading unless you have a hard drive. (And now it's a cart.)

I *love* TB -- its speed, it's compact memory model, its added features. It loads from a HD in just a few seconds, and I use MyDos 99.9% of the time, so there is no memory conflict.

I *don't like* the TB compiler since it will not generate a compact, stand-alone program like Monarch's ABC.

2-cents worth...
Larry

Your sites back up Steve, and I must say it's looks cool, I have an
Atari 2600 and it still rocks. :)

Anyway, It dosen't look like you need it anymore, but if your host is
still giving you the shits, it's a very painless move over to m6.net

I've been searching for a new, fairly cheap host for a while, and
these guys are not only cheap but they are probably the biggest geeks
ever. (you can see a photo ov em on the front page)

BE WARNED though, their website is about as appealing as my
girlfriends cooking, however under that ugly-ass site there really is
value for you $'s.

Good luck with your product!

Ditto. I too have a copy of it here and it was very much worth the 3.99 I
paid for it from B&C some years ago. It was/is an excellent Basic, but a
LOUSY compiler.

> AFAIK some of the XEGS carts were 128K.Thatï¿½s not much.

Theoretically, the size of an ATARI cartridge is unlimited (in the computer sense of this word). There are two areas that can be bank-switched by an cart: $8000-$9FFF and $A000-$BFFF. Additionally, the Area of $D500-$D5FF can be used as the control for an cart or as additional in/out.
So, there are a lot of possible bank-switching schemes possible.

The biggest "industry size" may be the XEGS carts with 128K, see http://www2.asw.cz/~kubecj/acartdp.htm ...

> And anyone knows about battery-backuped RAM in carts like common on
> SEGA and Nintendo cartridges ?

At least the R-Time 8 cart has some battery build in (to power the clock chip).

I _used_ to have a link to such a warehouse in California, I believe.
I lost it when I lost the job. Basically, they had a warehouse _full_
of computer equipment, and they just took pictures of everything. You
just clicked on any thumbnails that looked interesting, and there were
fully-boxed Atari systems, Commodores, etc. _Many_ Atari 1200XL
systems, etc.
I also remember the site was replete with profanity... if that reminds
anyone of what it might be...

Source record: 18725

Hello everyone

In the 80's had a Atari 800 XL, now (thanks to ebay) i am a happy owner
of a Atari 130XE.

I remember two great graphics programs called: "TECHNICOLOR DREAM" and
"ESCALPAINT".
Both used 256 colors and 80x192 (resolution).

Where could I find these programs in ATR or DCM format?

Thanks in advance
Morris - Italy

PS: Already have any prgs...see "TD2APAC.BAS" (but it is a converter
only), and COLORIZED 1.0!!

# 5713. Re: Technically best games on the ATARI 800 XL?

Yes, Ballblazer and Rescue on Fractalus are really best on Ataris. I think Draconus, Zybex and most Zeppelin games are great. Bounty Bob is very similiar on C64 and Atari, but I felt most confortable with the Atari version.

MULE is better on Atari (up to 4 players with joystick on Atari 800).

800XL's are cheap aren't they ? I like my 130XE the best, along with the tank Atari 800, which is the most robust one. Stands almost anything. It was on a computer course we had here in Norway and was dropped from a pretty high table. No troubles there.

TXG/MNX wrote:

> Hmm Turbo-basic was fast but didn't have a good compiler. I didn't compile
> to real machine code and needed a very big runtime file this was a problem I
> think.

The runtime was big, yes, but it _did_ compile to real machine code. I
distinctly remember running something like

```
10 POKE 53272, PEEK(53770)
20 GOTO 10
```

through it, and out came

```
@1: lda 53770
sta 53272
jmp @1
```

...as I later verified by examining the generated COM file. So it even
had some concept of integers (or, perhaps, these kinds of simple POKEs
were directly recognized and translated).

Best regards,

Sidney Cadot

There's a surprising amount of information about carts in the help of Atari800WinPlus:
Using existing switching schemes a 1Mbyte cart is possible as either XEGS or Megacart - but I'm not aware of anything using all that memory in the day.

Yes they (800's) are pretty rugged, but uhmm... there was this incident with
my first one back in 1983.
It was a cold winter, one of those winters that's cold and dry and
everything metal you touch shocks you. I touched my atari and actually saw
the arc go between the keycaps to the board below. Nevertheless it never
played pacman again, fortunately it was still under warranty and I got a
brand new one and I think I got a free GTIA upgrade with the exchange!

Hello,
I've been looking over the various ways to connect Atari peripherals to a PC. All I really want to do is write disk images onto real 5.25" disks using my 1050 disk drive. What is the easiest way to do this? Will the SIO2PC cable work? What about the 1050-2-PC or the ProSystem setup? What is the difference between all these methods?

Thanks,
Greg Andrzejewski

Message-ID: <Qvslb.965$wc3.312@newsread3.news.pas.earthlink.net>
Source record: 18736

Just wanted to know if anyone ever created a Windows based Atari assembler.

I've been using APE for quite some time (thanks, Steve!) and whenever I feel the need to screw around with assembly, I dig out my Atari Assembler cart, bang out my code, LIST & ASM it, then turn off the 130XE, pull out the cart, and do my thing.

It would be wonderful if someone had written a windows/Atari assembler that I could use to just crank out the code directly to an ATR instead of constantly removing and inserting the assembler cart and turning it off and on so much.

> on so much.

There is a linux assembler that can be used to write Atari programs:

http://www.cc65.org/

It also contains a C compiler for the 6502, but you won't need for
assembly, obviously.

Whether there is a port for windows I don't know, but I don't care that
much about win either...

Alternatively, use an emulator and a cart image.

So long,
Thomas

# 5730. In Search Of Basic Horse Racing Program - 2nd try

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-22 19:25:29 UTC
From: Randy T <nospam@diespammer.net>
Message-ID: <JQAlb.4253$pJ1.3956@twister.austin.rr.com>
Source record: 18743

I wrote a horse racing program in basic on my Atari 400 with a cassette deck on it 20+ years ago. I put it in public domain on the local BBS's. I was hoping that it survived for nostalgia purposes. I am not sure what the file was named. It was a 16k program and had 4 horses and some music and sound effects. You started with $1000 dollars to bet with. I was going to submit it to Atari but when they sent me the packet to do so, I found out that I might have a problem with copyrights on the music (The theme that plays at the horse races). So, I was to lazy to pursue it further. I was pretty proud of it as I wrote it before I ever saw similar commercial programs. If anyone knows where I might find this, please let me know. I found a couple of basic horse racing programs that were not mine in my quest.

I have also owned a couple of 800s and an ST before I moved on to the IBM compatible PCs. I am currently running an emulator on my Ipaq and have been having a ball with it.

Thanks,
Randy

Hello,

I built a 1050-2-PC cable and it works great. I built the version that can switch between 1050-2-PC and ProSystem. I haven't tried the ProSystem yet. I have all the Holmes games and utilities on the PC hard drive so I can make just about any disk that I want. Writing a disk is a slow process but it works flawlessly. You can even format disks from the SIO2PC program. It's also very cheap to make so it's a great project. I built mine in the case of an XM301 modem so the Atari SIO cable was already there. There was plenty of room for the 9 volt battery, power switch, mode switch, and PC serial cable. I use little perf boards for my projects so they are usually larger than the printed circuits that others make. I opted to use a battery because Atari systems already have way too many power cables.

I previously had made an Xformer cable but I couldn't get it to work. Someone told me to play around with the resistor value so I installed a pot and still it wouldn't work. Have fun.

# 5733. Wanted (UK): XE keyboard conductive paint bit

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-22 21:02:42 UTC
From: Mark Watson <newsAfoftDfsnetD@co.uk>
Message-ID: <SfClb.330725$Pk.51311@news.easynews.com>
Source record: 18746

Managed to mash the important part (bit of plastic inside with the traces painted on it) of my 130XE keyboard. Iirc replacements of these were available, I was wondering if they can still be obtained in the UK?

Or does anyone have a spare keyboard or plastic layer they can sell me? Maybe I should just get a complete XE on ebay...

Thanks,

Mark

The German edition had it in March 1987, so it's likely it was
around January of the same year... And yes, I did implement it
on the Atari 8-bit, using TurboBASIC XL.

I wrote a basic program years ago. I don't remember what the file name was. It had four horses that you bet on. You got $1000 to start with. I put it up on the BBS's. I was hoping that it survived somewhere. It was written on a 400. So, it was a 16k program. I would like to have it for nostalgia purposes.

Thanks,
Randy

Well, I would rather do that anyways, but I havn't been able to find an
Atari assembler image. I would rather do the actual programing in a familiar
environment, but I'll take whatever I can get.

If anyone here has a copy of the image, I'd be most grateful if it were sent
my way.

>All I really want to do is write disk images onto real 5.25" disks using my 1050 disk drive. What is the easiest way to do this?<

I built an (APE) 14C89 ProSystem cable, and it works well, but it still produces more formatting/writing errors than using 100% Atari hardware. I would still vote for using APE with a real Atari computer and disk drive. ProSystem is likely the next best method.

You ask about the differences. The hardware is very similar, but the ProSystem software is more advanced (IMO) and is available as Win or Dos. There is a *lot* of info at both web sites.

# 5747. Re: How common is the 800XE ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-23 15:15:31 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F97F093.5E291C93@students.uni-mainz.de>
Source record: 18660

Yep,
the 800XE is uncommon in western europe (and maybe rare outside
europe). Atari merely sold XE computers to eastern europe - no XL
computers, no 400/800 computers. Actually the 800XE is the same machine
as the 65XE. Another "unknown secret": Atari introduced the 400 and 800
computers to Europe in late 1982, at the same time the 1200XL arrived in
America. No 1200XL`s were sold then in Europe. Just 6-12 months later
the 600XL and 800XL arrived, so PAL versions of the 400 and 800 Atari
are also uncommon or rare. And there is no PAL version of the 1200XL...

The new XE computers were sold (mainly in eastern europe) from
1987-1992... the older XE`s were sold in western europe and elsewhere
from 1985-1987 (or maybe longer). There are some small differences
between older and newer XE`s, mainly the OS, the RAM (size of the) chips
and the motherboard (the newer XE`s always had a 130XE motherboard, no
matter if it was a 65 XE, 800XE or 130XE - upgrading was very easy
then). Alas, the newer OS in the newer machines is incompatible with
some software. And most if not all of the newer XE`s have faulty GTIA
chips which have to be replaced... greetings, andreas.

# 5749. Re: Max. cart size/battery in carts possible ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-23 15:21:55 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F97F213.E8898F67@students.uni-mainz.de>
Source record: 18662

Well,
I have read, that a bank-switching cart can have up to 256 banks of
16kbytes each. So I guess the maximum size would be 4 Megabytes - enough
for most (if not all) Atari games. Even the biggest game could be stored
on cartridge this way... -Andreas.

Hello,
alas I cannot help you to track down these two painting programs. But I
am very interested in that TD2Apac converter. Therefore I can send you 6
medium/enhanced density images filled with Technicolor pictures and a
viewer... Just send me an e-mail. greetings, Andreas.

Source record: 18668

And,
as a matter of fact the other Basic compilers also did not produce
"pure" machine code. They just appended the Runtime module with the
compiled Basic file (so it looked like one ML file). Whereas the TB
Compiler merely produced the compiled file and you had to load the
Runtime separately. Both versions had their advantages and
disadvantages:

- if you compiled a single basic file with any of the Basic compilers,
you had just one single/stand-alone ML file; on the other hand, if the
basic program was multi-stage, then you also got multi-stage ML programs
(meaning you also had to load the built-in Runtime several times);

- if you compiled a single basic file with the TB compiler, you had two
files - the compiled file and the Runtime; on the other hand if you
compiled multi-stage files, the Runtime had to be loaded just once...

- not to mention the speed (the Basic compilers and the compiled files
were relatively slow, whereas the TB compiler and the compiled files
were extremely fast)...

just my two cents - Andreas.

How can i "burn" some OS (for example, sparta dos) to eproms, and connect to
the cartridge port ?
In other words, make a cartidge, burning binaries dumps from internet.

is it possible ?

# 5759. Pinging my Atari: Atari Ethernet Cart and Contiki Progress...

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-23 18:42:08 UTC
From: cmartin@ti.com
Message-ID: <482f186a.0310231042.34187770@posting.google.com>
Source record: 18672

Well, I was finally able to ping my 130XE and telnet
from my 130XE!

The only problem is that is is currently unstable and packets
are dropped. :-( I am currently investigating why this
happens. Hopefully, not because Antic is stealing too many
cycles. This could be a real problem.

But, this is what is working on the prototype:

*Contiki 1.0 with the telnet client program.
The email client and web browser applications
also compile, but will not all fit ,currently,
in the memory space. (This can be worked out
later, especially with the 1MB flash cart...)
*Pinging the Atari yielded many unanswered pings,
but when they did come back, they were answered in 20ms.

I have been contacted by Jens Schï¿½nfeld who is building
an adapter card for his Retro Replay cart. He wants to add
an Atari edge connector for the Atari cart port to the adapter.
This will allow the ethernet board or the SilverSurfer fast
UART board to be connected to the Atari. It could be useful to
write a R: handler for the 16550 (in the SilverSurfer). This board
will have 32K internal as well. This may be useful, so I am
going to support his efforts on an Atari adapter.

I am still building the Ethernet stand-alone adaptor that will
be cheaper, of course! I am just waiting until it is
completely debugged. If Antic's cycle stealing habits are the
problem, then using the CS8900A for ethernet may not
be possible. :-(

So, the To Do List:
(1) Debug the dropped packets.
(2) Contiki 1.1 working.
(3) Atari Graphics modes for the gui (it is currently a
text-only based gui.
(4) Bank switching code for the 130XE or the Flash Cart to
allow more apps to be run.

I hope to have some more pictures posted before Monday of
Contiki running and the Ethernet proto board.

Regards,
Chris

## 5760. Where is Atari BASIC stored?

A000-BFFF BASIC cartridge (400/800) or ROM (XL/XE)
C000-CFFF Garbage on the 400/800; interrupt handlers &
character set on the XL/XE
D000-D7FF memory mapped I/O chips
D800-DFFF floating point routines
E000-FFFF character set and OS

Never had a 400/800, but IIRC the 800 has only 48KB, not 64KB. The 800 XL does have 64K and you can switch off the ROM in software, both for the BASIC ROM between A000-BFFF and the other ROM between C000-FFFF; furthermore, you can map the 'hidden' 2K under the memory chips into $5000-$57FF, enabling the selftest-rom. The 130 XE had 64KB which could be mapped into RAM using bank switching following pretty much the same technique.

Transfer of control to the cartridge (or BASIC ROM on the XL/XE) happens only after quite a lot of OS initialization (interrupts, devices, etc.). If you're really interested, you can get reverse-engineered assembly sources for most OS'es and BASICs at

http://ch.its.tudelft.nl/~sidney/atari/

Since I never had a 400/800: could somebody tell me what you get looking at the C000-CFFF area on one of these?

Best regards, Sidney

$40 is expensive? You surely will spend more creating one by scratch, and
the time alone is not worth it.

Well you will need a Amiga 1020 5.25" drive or compatible. The software is
freeware: 551conv from Aminet. Works like a charm. You could transfer a
.ATR on a PC 720k disk to Amiga with CrossDOS.

Sorry about the repeated Post. This one came from my IPAQ after I thought
it got lost somewhere. After a couple of Syncs it decided to show up.

"Randy T" <nospam@diespammer.net> wrote in message
news:z7Olb.800$%x5.214@twister.austin.rr.com...
> I wrote a basic program years ago. I don't remember what the file name
was. It had four horses that you bet on. You got $1000 to start with. I
put it up on the BBS's. I was hoping that it survived somewhere. It was
written on a 400. So, it was a 16k program. I would like to have it for
nostalgia purposes.

TASM is a good 6502 assembler, though it is not Atari specific.
I use it for pretty much all my Atari projects. You can download a copy
at:

http://www.atarimax.com/flashcart/documentation/

At the bottom of the page there is a link to download TASM. There is
an extensive users manual in the archive as well.

Nothing, really.

Atari wasted that 4K block; the Omnimon monitor was released as an add-in
for the OS ROM board that mapped into that location.

The 400/800 OS ROM was 10K: I think it was $D800-DFFF for the floating
point, and $E000-FFFF for the rest.

What do you mean by that? Are you saying "are 64K carts possible", or do you mean you want one that is limited to 64K?

IIRC, isn't Steve's flash cart one megaBIT? As in 128K?

That should be plenty of space for you, plus it's "re-burnable" an infinite number of times...

Oooh, I just checked the page. I didn't know that he already had the 8MBit cart available... Sweet.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Yes. I have put together a web page today containing information on the project here:

http://jybolac.virtualave.net/atari/a8ether

I still have a few experiments to try, but it doesn't look promising that the cs8900a will be a viable solution for the Atari. With Antic stealing so many cycles, our poor Ataris cannot keep up. :( I have hope though that this may still work. If not, I am looking at the SMSC LAN91C96 chip which allows IRQs in 8bit mode.

A web browser may still work by blanking the screen while it builds the page. I want to avoid doing this though.

```
* Atari 1090XL Interface Box

Ever look in the back of an Apple II or an IBM PC, and envy the expansion
cards? Atari was planning to release a similar expansion box. The full specs
were written up, and prototypes were sent out to hardware developers. As
usual, Atari took this great idea, buried it, and forgot about it. Add on
cards included CPM and 64k RAM. These are EXTREMELY rare; I've only ever
seen two for sale. Definitely collectors pieces.

As i was reading.. there are like 50 1900Xl , with ram expansion cards,
80column video cards...
```

I heard that most of these were shipped to third party developers to
experiment with. Because they were lab rats, many did not ever have covers
and probably very little documentation.

Source record: 18601

Atari Basic is stored at $A000-$BFFF (40960-49151).

The Atari 800 does not have a 64 KB RAM. Although the 6502 has a 16 bit address bus, so it can access 64 KB, the architecture used less than that. Part of it was ROM, another 2 K were used for I/O. The Atari 800 had 48 KB RAM. Newer machines, like 800XL anf 130XE used bankswitching to get more RAM.

I was about to do a Dungeon Master game for the 8-bit a long time ago. But,
I am no graphics master and couldn't draw the items I needed. I had the
whole game pretty much covered, but without graphics, there's not much fun
is there :-/

What happens on one of these when you do PEEK()? Do they resolve to a
single value (zero, 255, or anything else) in this range, or do you get
a 'random' value?

> The 400/800 OS ROM was 10K: I think it was $D800-DFFF for the floating
> point, and $E000-FFFF for the rest.

Yes; 2K floating point, 1K character set at E000, leaving just 7K for
the OS; mainly interrupt handlers, centeral I/O (device abstraction),
and device drivers (of which a big chunk is taken up by serial I/O). The
functionality they managed to squeeze into this 7K is pretty impressive.

Still, I've gone through most of the code by hand for my project of
reverse engineering the ROMs and I can attest that 7K of 6502 code is
actually quite a lot :-)

If you look at the 16K roms of the XL/XE models, it is clear that there
was relatively little useful stuff added in the 6K that become
available. 2K for selftest mode, 1K for an extra character set, and a
pretty big piece of code for the peripheral device handler (which most
users never used).

The 5200 had only a 2K ROM(!) with 1K being taken up by a character set,
and 1K worth of interrupt handlers and initialization code. Now there's
a compact OS if I ever saw one (if you can call it an OS...)

Best regards,

Sidney

Would it be possible to make a XEP80 a requirement, then you
could just turn ANTIC off? It limits who can use it, but
80 columns would help when telnetting or surfing the web
anyway!

That'd be an awesome accomplishment if someone actually managed to host a
site using a 130XE. Site wouldn't be much for content though...

> single value (zero, 255, or anything else) in this range, or do you get
> a 'random' value?

You should get a single value, I would expect 255. If you peek in this
area, no "chip select" line is active, leaving the bus in tri-state. TTL
compatible devices typically react on an open input as reading a logic
"HI" level.

However, this "HI" is quite "fragile" in the sense that possible
external noise might cause some bits to flip.

> Still, I've gone through most of the code by hand for my project of
> reverse engineering the ROMs and I can attest that 7K of 6502 code is
> actually quite a lot :-)

You find here

http://www.math.tu-berlin.de/~thor/atari++/

under "Os sources" an Atari compatible operating system which
manages to sweeze even a file management system ("a DOS") into the
lower 0xc000 to 0xcc00 area and a "DUP" into the selftest. This
is really very tight...

> If you look at the 16K roms of the XL/XE models, it is clear that there
> was relatively little useful stuff added in the 6K that become
> available. 2K for selftest mode, 1K for an extra character set, and a
> pretty big piece of code for the peripheral device handler (which most
> users never used).

It is really astonishing how much code in the XL/XE Os is spend for this
additional hardware that actually never appeared...

> The 5200 had only a 2K ROM(!) with 1K being taken up by a character set,
> and 1K worth of interrupt handlers and initialization code. Now there's
> a compact OS if I ever saw one (if you can call it an OS...)

Not really. There is no such thing as "handlers" or "serial device"
transmission service, i.e. no SIO, no CIO, no S:, E:, P: or C: handler.

So long,
Thomas

# 5801. DGS Atari 8-bit CD-ROM - New lower price & SCART/RCA Atari cables

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-26 17:35:58 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1067189751.48803.0@lotis.uk.clara.net>
Source record: 18614

Hello All,

Couple of items of news:

I have combined most of the contents of our 2 Atari 8-bit CD-ROMs into a single product at a much reduced price. This new CD-ROM includes all the PPP products (Quick, SAM, Quick Ed, Games), the DGS products (Digi-Studio, 26 issues of our magazine), the Rambit product Print-Filer, our 22 minute video shot at the AMS 96 show (in MPEG-1), and 13 selected PD disks. The products are the same as before, will full manuals in PDF format. All disks are included in DCM and ATR formats. This new CD-ROM is available now for just US$9.99, which includes airmail/1st Class shipping to any country. This is less than half the cost of the original 2 CDs! You can buy now with a credit/debit card using PayPal. Please visit our web site: http://www.dgs.clara.net

We are also now directly selling our range of Atari 8-bit SCART and RCA phono cables, which can be made in various lengths and types. Please visit our web site: http://www.dgs.clara.net

Whoa! I did not expect this to be on the slashdot front page all
day on Sunday. I was just giving status.

You know you are a geek when your hobby exploits show up on
slashdot. :-D

I have to say that I am not the only one responsible, though. A lot of
work has been done by Adam Dunkels, Christian Groessler, TXG/MNX and
others.

Hopefully the bugs can be worked out, and we can get people coding on
doing network games, samba fs, ftp, etc...

Anybody knows if all 17 Scott Adams adventures and
the 11 Mysterious Adventures by Brian Howarth were
released for atari?

I used to play some of those, I only finished Strange Odyssey
however it'll be nice to have again those games for playing
in the emulator.

can anybody give some tips

German

I have 10 of the Mysterious Adventures, what is the eleventh ? At least 10
were released of Scott Adams series along with the Questprobe ones, Hulk,
Spiderman and Human Torch and the Thing. Sorcerer of Claymorgue Castle (sp?)
was released. SAGA was of the six first only, wasn't they ? SAGA was
released for the QP series and SOCC. I finished them up to 8 or nine myself
I think.

That is great Chris. Just to get this far is an accomplishment. I
cannot wait to try to this out for myself when all the bugs are
ironed out and the hardware is done. Good luck...

Source record: 18628

I am wanting to perform some mods on my Atari 600XL. The 64k upgrade, and the 5-pin monitor jack mod. The memory upgrade looks straight forward, but the monitor jack upgrade puzzles me. I am worried that I may trash my 600XL trying to install a jack. Has anyone perfomed this mod? And if so do you have pics for me to get an idea on where you installed the jack?

Thanks
Tim

Oh the rotten luck! You are the owner of a 1090 XL. I find it funny that
a ST user would happy to throw that in.

As for what to do with it... did anyone ever get a couple of working
daughterboards that could be put in that?

Well, truly cool in many ways.

Not able to keep up eh? Any way a buffer could be created to help on the
overflow? (Taking a cue from the Black Box which I believe had a printer
buffer for overflow.)

Other than that, awesome! :)

I do that. I've got a Tandy Color Computer 3 next to my Atari 130XE in the "old computer" room.

If you mean have the 6809 run the Atari's software -- not very likely, as the instruction sets are totally different, as is the interface logic that is needed to tie the CPU to the rest of the system.

Marvelous! And to think I just bought an ether board for Atari
experimentation!

Could you also use DLIs to monitor the cs8900a, thus reducing Antic's
nefarious influence, and perhaps avoiding the need

As for the Cart interface, what is its memory footprint? IE how much RAM
is deselected? Would it make sense to include fundamental routines in ROM
in the cart, thus using some of the memory space otherwise wasted? Or
would the additional logic needed in the cart be too much?

Forgive the questions, I'm just excited to see this progress for the Atari
8 (and I'm sure the Slashdot interest helped, too)

Source record: 18633

ericcron@yahoo.com (Eric Cron):
>Is IP going to be available from staright Atari OS? Or is Continki
>going to be required?

I think that Contiki is built around the uIP tcp/ip protocol stack of Adam Dunkel's. So you could conceivably use that and make your own one-off tcp/ip applications (using cc65 of course.)

>Either way, the apps will need to be written in C and compiled with
>CC65?

The point of Contiki (IIRC) is to provide a multi-tasking evironment that uses one tcp/ip stack and one windowing/process system.

Contiki includes an API for building applications. You may be able to "hook" into that with some other language. CC65 allows you to build applications using C, assembly or a mixture of both.

By: zothen@my-deja.com (Zothen Runecaster) to comp.sys.atari.8bit on Mon Oct 20 2003 12:33 pm

> The question is : Was Turbo BASIC unknown in the US/Canada ?

The Turbo BASIC I know for the ATARI 8-bit came in two varieties -- FrOst BASIC for the 800, by Frank Ostriski(SP?), and Turbo BASIC for the XL/XE. It was known in the U.S. and Canada, but it arrived late. It came with a "Towers of Hanoi" program to demonstrate its speed. Most BASIC developers, like Shadow, were using XE carts by then, and the programming had moved from ACTION! and FORTH to the small-C environments of A.C.E. C-88 and John Dunning CC65. I think it was a timing problem, but Turbo BASIC is as every bit fun to use as C= 64 COMAL.

The controls are crap on Atari version, the only good thing is the music.
You need to collect all those things (clean up after your party) and I think
on the Atari, it's not possible, due to lousy control. Did almost manage it
on the ZX Spectrum waaaaaaay back!

# 5829. FS : Boxed+new ATARI XL/XE cartridges

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-28 07:33:53 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0310272333.68bfc2d7@posting.google.com>
Source record: 18638

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide :

$7 1 game surface mail (slow)
$9 1 game air mail (fast)
$14 for a package of up to 15 games as surface mail (slow , 3-8 weeks)
$32 for a package of up to 40 games as surface mail (slow , 3-6 weeks)
$23 for a package of up to 8 games as Air Mail (fast , a few days)
$33 for a package of up to 15 games as Air Mail (fast , a few days)
$48 for a package of up to 40 games as Air Mail (fast , a few days)

Europe : please ask

Please note : Paddles/Joysticks/Keyboard Controllers weigh about 3 times as much as 1 game.

And "Eastern Front" weighs as much as 2 games because of instructions and map , Gato,Star Raiders 2 and Tennis about 1.5* as much as the other games.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias Graef

ulrich_sternaxe@gmx.de or lord-chaos@t-online.de

XEGS carts are the cartridge games in the blue XEGS boxes.They work on ATARI 800 XL , 800 XE , 65 XE , 130 XE and 1200 XL and the XE Gamesystem.

Some require 64K, so they wonï¿½t run on the ATARI 800.

If you want to see pictures of the gamesï¿½ boxes,instructions and carts,
please use the links.

I am not too sure, I asked several times for help on my Box World game. I would need the different walls in some different positions, all creatures, bars, handles, buttons, torches, stairways and yes, you got it, all of it.

Don't think it would run at 60fps :-/ but then again, DM isn't supposed to.

Try this http://www.fonck.nl/atari/ , I take it you have an American model. My aussie one already had the socket, just the chroma luma was not there, it only took a few minutes to sort out tho. The above hack is quite rough mine was a lot prettier:-). I did both the video and ram, quite easy. I will attempt to put 1088k in soon as I have some free time.

Don't know but SA released most of his games as freeware along with a
Windows based interpreter - available from his web site.

# 5834. Same name, different games? (Was: Jet Set Willy)

Hi there, Vidar!

I have probably only seen an illegal copy of a game that was supposed to be "Jet Set Willy" on the Atari 8-bit computer. But from what I can recall, it did not look like the famous ZX Spectrum game at all. Is it really a conversion of the Speccy version, or is it a different game with the same name?

My guess is that the Atari version of "Jet Set Willy" is an attempt by a UK games company (which?) to release a cheap rehash of the the famous JSW title and release it in 1987-1988 (another guess), at the time when the Atari XE computer series unexpectedly took market shares in the UK.

There are other known cases where the differences between two home computer versions of a game are big.

One example is "Caverns of Khafka" on the Atari and the C64. Both are good games. While the Atari version features small, detailed and colourful graphics, the C64 version has very big objects and generally less details and interaction. These are two totally different games with a similar concept. Robert T. Bonifacio, where are you today? You are my16 KB hero! Honestly. OK, I found you:

http://atari.games.free.fr/atarixl/authors/robert%20t.%20bonifacio_e.htm

While we are at it, this could be the same Cosmi company that made "Caverns of Khafka", "Forbidden Forest" and possibly some other Atari titles: http://www.cosmi.com. I think I recognize the company logo.

Another example is the helicopter game based on a TV series. Although the TV series was popular during the 1980s, I am not sure what it was called. Was it "Airwolf"? The C64 game is a modern, released circa 1986, while the Atari version is a bit simplistic and feels old. I come to think of a game called "Blue Thunder"? "Blue Thunder" was probably re-released under the "Airwolf" name for the Atari.

## 5835. Atari computer and "Trolls"

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-28 11:18:15 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <bnlj7s$4t2$1@newstree.wise.edt.ericsson.se>
Source record: 18548

I thought if I post this only in comp.sys.atari.8bit and not
in comp.sys.cbm, comp.sys.sinclair et cetera, I will get the
best answer and not so many replies from people who are not
interested at all in Atari computers.

I have occasionally seen articles and replies about "trolls"
and anagrams in this newsgroup during the last couple of
months. One article is fairly new.

Does this have something to do with computers, old computers,
8-bit computers, Atari or anything? Or is it a modern (internet)
phenomenon? The author of the most recent post seemed as if
he felt this was interesting or even important information.

What is a "troll"?

Anders

This was released I think by Tynesoft and is NOT programmed by the same
author. But, I do believe the levels are the same, just that the jumping
technique is awful. And the PM's are not very pretty. Brilliant music,
that's the reason to get the game.

Yes, Airwolf was released under two names, but the Atari version was not the
same as the C64 version at all. And you are right about most Cosmi games,

they were better on the C64 (hate to say things like that)

A troll in Internet terms is someone who posts something that is deliberately designed to get a reaction. These sort of posts are usually either aggressive, inflammatory or just plain weird.

Hmm I think the best solution is NOT to use DLI's to solve the problem. Why? Just because when people want to make programs for this interface like e-mail, IRC and maybe some others, DLI's could be used to produce some colors in the screen. It already have been tested and could run very well without DLI's so let's keep it that way.

Using a new chip with IRQ in 8-bit mode is not really usefull I think because the IRQ routines take a lot of cpu power when being executed for each packet. Also IRQ's are not usable when ANTIC halts the cpu.

TXG/MNX

If you look at the comp.sys.atari.8bit FAQ, you will
find a complete listing of 8-bit mem upgrades under
the RAMDISK section.
There are at least a dozen of them.
There's Claus Buchholz, Newell and Rambo as probably
the most common. Bob Woolley has many also, and
probably there are a number of websites that explain
making homebrew ones.
Best Electronics, maybe Video 61 and Ben Smith,
and B&C may have some for sale.
Check the FAQ and maybe the Vendor's List.

Why is it people always seem to have to critique someone's asking
price? You either are interested, or you aren't. Criticizing
someone's post of an offer only serves to discourage offers from being
posted. If you don't like the deal, move on to the next post. This
isn't meant to be directed at any one person even though it quotes a
particular post. People are wise enough to make up their own minds
about what they think is reasonable, and if they aren't. well then
they can ask for advice or learn by experience.

Just my take.

Thanks for listening.

You must be trying to cause an argument or flame war. I much prefer ads to flame wars for damn sure. In this age of megabit broadband (or even modem) I don't consider his ads to be much of a problem to dispense with. Why do you complain so about it when it's literally milliseconds of download time?

I'm not sure about software, but in college I remember a professor
explaining plagiarism as it relates to written works. The example he
used is, that it is plagiarism to include parts of one work into
another without giving credit (or permission as the case may be). He
said that if you read a work, learn or comprehend it so that you have
the knowledge, you may then write drawing upon the knowledge that you
have, and what you have written is your own.

I guess I'm trying to say that just because Thomas learned of
techniques or coding ideas from learning other's source code, that
doesn't mean strictly that code he writes is infringing.

The professor wasn't a layer. I am not a lawyer. And it was about
written works, not software. So I don't know if it means anything
here.

I do know that this whole thing is a shame though, and I'm not blaming
any one side for it.

Hi!

When I read your posting I had to think about a saying here in the
Netherlands:

Stealing from one person is Plagiarism.
Stealing from more people is called research ;-)

By the way... I think those emulator writters should work together in stead
of fighting. Every emulator is welcome to me, even it has 99% stolen code.
The atari win plus emulator for instance is the very best imo. That one is
completely based on the atari800 emulator (atari800.atari.org).

By the way (a bit off topic) NOTHING beats the real thing :-) so my atari
65xe 320kb with MyIDE and build in CompactFlash memory Card rulezzz forever.

MArius

I seem to remember a 6809 board being made for the Apple 2. Plus, there was
a Z80 card for the Color Computer, also a very different CPU from the 6809.
Are you sure this couldn't work?

Years ago, I used to day dream about the ultimate 8-bit computer. It would
have slots like an Apple 2, the 6809 and OS9 operating system of the Color
Computer, and the graphics/sound chip set of the Atari, along with a full
range of I/O ports, a nice detatchable keyboard, and of course, tons of RAM.

## 5854. C++?

This is a very old debate. The claim was that Thomas took code verbatim
from others' work, not that he merely learned about techniques by reading
that code. Thomas claimed otherwise. I don't recall the details beyond
that (it was several months ago). I looked at some of the code in
question at the time, but my knowledge of the emulation topics in
question was (and is) slim enough that I was (and am) reluctant to draw
any conclusions.

> By the way... I think those emulator writters should work together in stead

They are. There was a big brouhaha about it in February, but it was
resolved by Thomas changing the license to his code to a variant on the
MPL, IIRC. SgtSilicon was replying to a post that's almost nine months
old, as revealed by the attribution:

Well,
why not steal some graphics (i.e. convert them) from other Computers,
like C64, Atari ST and Amiga for this project ?!? Nowadays there are
lots of converters available for GIF, BMP, JPG, IFF, Degas, TIF, etc.,
so that Gr. 8, Gr. 15, HIP, RIP, TIP, RGB and many other formats are no
big problem... -Andreas.

P.S.: Better a new game with "stolen" graphics, than no new game...

That might be a good idea. Is Dungeon Master on ST graphics easily
accessible ? If you can extract the walls and monsters, please do and send
me a picture and I see if that's something I can use. I am more keen on
doing my Shining Force type game, but whatever I get the time to do, I'll
try to start it up again!

Take Atarian care

My unit was foobar, I had to repair it before even starting. It was quite cool I even desoldered some LS chips from a Amiga 3000 to get it working, and repaired stuffed pins on the custom IC's. On Pal models (like mine) the video mod is simple, just add 2 resistors and cut a track. These ones already have composite video and sound. As far as I know you can still use the RF, could be wrong tho, didn't look at the NTSC models. I will open her up tomorrow and post some pics.

# 5864. 5 1/2 inch floppy disks

Newsgroup: comp.sys.atari.8bit
Date: 2003-10-29 23:35:44 UTC
From: iquitted@collegeclub.com
Message-ID: <bba8af7b.0310291535.fc22b21@posting.google.com>
Source record: 18577

I have a lot of old 5 1/2" Atari 800XL disks that I'd really like to convert to disk images that I can use on Rainbow, or another Atari emulator, on my Mac. I have a friend who is letting me use her old PC, which has a 5 1/2" drive (and Windows 3.1). I found a program called SpartaRead that's supposed to enable you to read Atari disks on a PC, but whenever I try to get it to read my disks, it says, READ_SECTOR Error #6, READ_SECTOR Error #2, READ_SECTOR Error #4. I've tried several different disks, and it says that for all of them.

I'm wondering if maybe my friend's computer doesn't have the right kind of 5 1/2" drive. If it doesn't, how can I get a drive that will read my Atari disks, but work on a PC (or Mac)? Is there some way I can connect my old Atari disk drive to the computer?

thank you.

jeremy

# 5865. Old game - "Prisoner 2" - solve?

Newsgroup: comp.sys.atari.8bit

Hello,

I'm curious to know if anyone has ever solved the early 1980s game called "Prisoner 2" (Apple II and Atari 8-bit, I think). It was written by David Mullich and produced under the Edu-Ware label, I believe. I'm not even sure if it is possible to solve it, as most things in the game don't really seem to have a purpose. Does anyone have a solution for this? I did a search on Google and Google Groups, but to no avail.

Stephane

I got this post from comp.sys.apple2 and thought it would be good to pass
along....

http://news.com.com/2100-1028_3-5098639.html?tag=nefd_top

From the article:
Feds grant DMCA exceptions
Last modified: October 28, 2003, 6:16 PM PST
By John Borland
Staff Writer, CNET News.com

The U.S. Library of Congress created on Tuesday four narrow exemptions
to a controversial digital-piracy statute but was criticized by
free-speech activists, who had hoped for more exceptions.

As part of a regular process of reviewing the Digital Millennium
Copyright Act, regulators created four new instances in which it is
legal to crack digital copyright protections. Such protections can now
be broken to access

? Lists of sites blocked by commercial Internet filtering software, but
not spam-fighting lists
? Computer programs protected by hardware dongles that are broken or
obsolete

<IMPORTANT ONE!!!>

? Computer programs or video games that use obsolete formats or
hardware

<Should include anything Apple II, Atari, or TRS-80, etc.>

? E-books that prevent read-aloud or other handicapped access formats
from functioning

Quoted from comp.sys.apple2-Greg B.

-Looks like my happy drive is finally legal!

Oh, everything had a purpose. Though not in the direct sense that a
modern adventure game would have. And you can certainly solve it. I
did.

You might want to search for "Prisoner" as well as "Prisoner 2". As I
recall, they had the same game design, or nearly; the big difference
was that "2" had fancier graphics. (1985 instead of 1980. :-)

I don't believe I've seen a walkthrough. I solved it by looking at the
BASIC source code... which was, I decided, entirely within the spirit
of the game.

Well I searched, and I searched, and then I searched some more. After over a week of looking I have found the info I was searching for. Back in the heyday when I ran my BBS I installed a 576k upgrade on my 130xe and it wasn't easy. But, I was looking for that one as well as other 8bit ram upgrades and the info just wasn't readily available. I found a link today to a site that has all the documents including the one I installed. Hope this helps somebody and I apologize if I give away a link i'm not supposed to.

Emulating the behavior or characteristics of something is not a
copyright violation. I know Apple tried to say that about Windows but
it doesn't make it so. Emulators are not inherently using up any
copyrights. Now the ROM files are another story.

It is not a no no. Emulation is not a copyright violation. Where
does this false rumor come from? Emulation is well established as not
being a violation of copyright.

Those that insist that emulation is a copyright violation, please site
the relevant law or precedent. I can tell you right now Apple lost to
Windows, IBM lost to (I think it was Phoenix) over BIOS, And Intel
doesn't even try to say AMD can't have compatible operability (right
down to the register).

So for example, an AMD CPU which works just like an Intel one is
perfectly legal as long as the circuit mask or microcode is all
independent. The fact that it BEHAVES like an Intel chip doesn't mean
a thing. Likewise, an emulator BEHAVES like the real thing but does
not get there the same way as the original and is also legal. The ROM
files are protected by copyright and agreements can be enforced if the
rights holder chooses to bother, which is questionable itself on
something so old as Atari 8bit ROMs.

For details on the Atari 800 web server (and the BASIC program) look no
further than http://kl.net/atari/

Strictly speaking, it wasn't a web server, as there was no effort on the
part of the Atari to parse the incoming connection (not RFC compliant).
But that will come soon enough...

Source record: 18590

Two 8086 Assembly Language Questions..

Hi Friends,

can anyone help me with this : I am unable to do my 2nd Sem
assignments ..

1>Write a 8086 assembly language subroutine that can be used for
passward matching.

Interface/call this subroutine from a C program.

2>Write a program in 8086 assembly language that accept two floating
point numbers from the screen in format:

ddddEsee

where,

dddd are four decimal digits

E is exponent symbol

s is sign

ee contains exponent value.

A decimal is assumed prior to four decimal digits.For example a number
45 in the above format will be:4500E+02.The program adds the two
numbers if the exponent value is same,otherwise issues an error
message"Exponent does not match".

Thanks,

Madhumita

It depends whether you want to convert 180K double-density disks (these
can be read quite easily on a PC drive), 127K 'enhanced density' disks
(not possible, as far as I know), or 90K 'single density' disks
(possible, but non-trivial).

For the latter, check out the comments at the bottom of my atari page:

http://ch.its.tudelft.nl/~sidney/atari/

The very best solution is to get a SIO2PC cable that allows you to
connect an Atari drive to a PC via the serial port; this works very well.

Regards,

Sidney

> I've tried several different disks, and it says that for all of them.

I'd say the best you can do is to buy or build a SIO-2-PC cable and
connect the 1050/810 drive to the PC, then build disk images by either
running Matthias Reichl's AtariSIO on the PC, or directly an emulator
that can boot off an Atari floppy, e.g. atari++.

> If it doesn't, how can I get a drive that will
> read my Atari disks, but work on a PC (or Mac)?

I suppose the only drive that can really read these formats is the original
Atari one. PC drives (or rather, PC floppy controllers!) seem to have trouble
to understand anything but the standard PC format.

> Is there some way I
> can connect my old Atari disk drive to the computer?

Clearly, see above. Even directly to an emulator.

So long,
Thomas

Hi,

> I'm interested in writing a 'special purpose' Atari 800 emulator. Can
> someone suggest the documents I need to understand the Atari hardware
> well enough to write an emulator?

I suggest "De Re Atari", and the documents at the Atari Historic Society, specifically, the atari internal documentation for the chip set. Personally, also used a very good german book "Das Atari Profibuch" I can highly recommend if you speak german.

Plus, "Use The Source, Luke!". Most emulators are open source projects and you can read how they work (but beware of the GPL. For a non-GPL'd, see here: www.math.tu-berlin.de/~thor/atari++).

So long,
Thomas

Hi,

> It is not a no no. Emulation is not a copyright violation. Where
> does this false rumor come from? Emulation is well established as not
> being a violation of copyright.

That was actually not the claim; neither whether it is/was a "copyright violation" (in a strict sense) to begin with. The problem is rather about licences (namely, "contracts" between the author and the user that extend the rights of the user beyond that granted by the copyright law). In this specific case, about the GPL licence which grants users the right to use the original source, but does not grant users the right to choose any other licence for "derived work". ("The GPL virus") I personally disagree with this part heavily, not with the open source part, though that is a completely different topic and should not be discussed here.

To be specific, the question was/is whether atari++ is a "derived" product from the atari800 emulator, and the opinions about this point disagree, to state this as neutral as possible. After all, I think this conflict was settled to, as I hope, the best of both sides, and I see little reason to start the discussion all over again.

> The ROM files are protected by copyright and agreements can be
> enforced if the rights holder chooses to bother, which is
> questionable itself on something so old as Atari 8bit ROMs.

Clearly. The original ROM images are copyrighted, and so is their source. I clearly agree that a work-alike of the ROMs is not under the copyright of Atari and its current owner. (Thus, I had little trouble of putting a ROM emulation code into the atari++)

Anyhow, we're here entering the realm of the legal system which is in itself not always as logical as it could. I personally tend to feel (fear?) that too often the party with the better lawyer (and, thus, more money) gets the "right" on their side, but that's another question yet again that should remain unanswered in this group.

So long,
Thomas

Hi,

> Two 8086 Assembly Language Questions..

Sorry, wrong group. We speak here "6502". (-;

> 2>Write a program in 8086 assembly language that accept two floating
> point numbers from the screen in format:

The 8086 does not provide a FPU (unless one is connected to the chip
externally, but that's not said here), and thus, you'd had to do all
the math yourself. Unless you have an environment that provides floating
point in the described format (as for example, the Atari Math Pack ROM),
have "good luck". (And please, do your homework yourself... ;-)

So long,
Thomas

I have kind of switched hobbies away from programming in the last couple of years.

That being said, yes but it takes a different form now.

Typically I examine the obj/asm code output by any compiler. There is a big lie, that compiler writers are so smart a normal human being can not improve on their code. I've done this with both Borland Turbo C and gnu C and found code that can be further optimized. It is only important for time critical code, but a decent assembly programmer can still outperform the worlds best compiler writers.

There are tricks people use with high level languages to get them to perform better, but I find these to be esoteric at best and confusing at worst.

I would try comp.sys.tandy there are alot of 8086 guru's there.
Good luck, and it never hurts to ask.

>That was actually not the claim; neither whether it is/was a
>"copyright violation" (in a strict sense) to begin with. The problem

Actually I (thought I )was specifically responding to a claim that
emulation is in itself a copyright violation issue. The argument was
basically that the original authors of Atari800 (who GPLd it) are
hipocritical to be concerned with Thomas's (your) violation of the
GPL, while they themselves violate the copyright by merely emulating
the Atari. I say this is an invalid argument, since there is nothing
violated by emulation, and therefore their position is not a
hipocritical one.

I am aware of what the over-all thread was about. And in case anyone
cares, my position on that is I would have liked to see them not get
all over Thomas (you) in the 1st place, but do not deny it was their
right (provided Thomas (you) had in fact lifted source code, which I'm
not prepared to weigh in on one way or the other).

So to sum up....

Thomas, I thought it was great what you were trying to do. Emulation
is legal, both for you and the original Atari800 authors. The ROMS
are copyrighted but legally distributed in XFRMER. Once you have
ROMS, you may plug them into whatever you have in the house; even your
toaster if it gets you something out of it.

Peace.

Good advice is to study harder. Just looking for someone to do the
assignments is weak. And it's also not related to Atari8. If you
have legitimate questions regarding part of your assignment, I suggest
you try an x86 group or assembly group.

Nick Kennedy was the inventor of the SIO2PC cable. You can check out
his website at <http://www.tcainternet.com/wa5bdu/sio2pc.htm> for
instructions on how to build one. You can also check E-Bay, they
sometimes have them for sale.

Source record: 18510

```
Hi Friends,

can anyone help me with this : Please check if it i s correct.

1>Write a 8086 assembly language subroutine that can be used for
passward matching.

Interface/call this subroutine from a C program.

Here is my solution :

;ALGORITHM :

=> Initialise variables
=> accept password
=> check password
=> If password correct then display message
"You are allowed to access all facilities"
else display "Please try again"

;REGISTERS : Uses CS, DS, ES, AX, DX, CX, SI, DI

DATA SEGMENT

PASSWORD DB 'FAILSAFE' ; Source String

PASSWORD DB 'FEELSAFE' ; Destination String

MESSAGE DB 'You are allowed to access all facilities'

MESSAGE1 DB 'Please try again'

DATA ENDS

CODE SEGMENT

ASSUME CS : CODE, DS : DATA, ES : DATA

MOV AX, DATA

MOV DX, AX ; Initialise data segment register ; as destination
string is
; considered to be in extra
; segment

LEA SI, PASSWORD ; Load source pointer

LEA DI, DESTSTR ; Load destination pointer

MOV CX, 08 ; Load counter with string length
```

```
CLD ; Clear direction flag

REPE CMPSB ; Compare the 2 strings
; byte by byte

JNE NOTEQUAL ; If not equal, jump to
; NOTEQUAL

MOV AH, 09 ;else display message

MOV DX, OFFSET MESSAGE;

INT 21h ; Display the message

NOTEQUAL : MOV AX,4C00h ; interrupt function to halt

INT 21h

CODE ENDS

END START
```

---

The above code can be written in C and interfaced with parameter passing as
follows:

```
PUBLIC PASSWD

.MODEL small, C

.CODE

PASSWD PROC switch : word

MOV AX, DATA

MOV DX, AX ; Initialise data segment register ; as destination
string is
; considered to be in extra
; segment

LEA SI, PASSWORD ; Load source pointer

LEA DI, DESTSTR ; Load destination pointer

MOV CX, 08 ; Load counter with string length

CLD ; Clear direction flag

REPE CMPSB ; Compare the 2 strings
; byte by byte

JNE NOTEQUAL ; If not equal, jump to
; NOTEQUAL

MOV AH, 09 ;else display message
```

```
MOV DX, OFFSET MESSAGE;

INT 21h ; Display the message

NOTEQUAL : MOV AX,4C00h ; interrupt function to halt

INT 21h

PASSWD ENDP

END
```

The C program to test the above code is as follows

```
#include<stdio.h>

int passwd(char pass[]);

main()

{
char pass[8];
int val=0;

printf("Enter password:");
scanf("%s" , pass);
fflush(stdin);

val = passwd(pass);

if(val=0)
printf("Please try again...");
else
printf("You are allowed to access all facilities...");

}

int passwd(char *s1)
{

char pass1[]= {"FAILSAFE"};
char pass2[]= {"FEELSAFE"};

char *s2, *s3;
s2=pass1;
s3=pass2;

printf("Checking Password.........");

while((*s1 == *s2) || (*s1 == *s3))
{
if((*s1 == '\0') || (*s2 == '\0') || (*s3 == '\0'))
return (0);

s1++;
s2++;
s3++;
```

}

return (1);
}

I am unable to find a solution for the following :

2>Write a program in 8086 assembly language that accept two floating point numbers from the screen in format:

ddddEsee

where,

dddd are four decimal digits

E is exponent symbol

s is sign

ee contains exponent value.

A decimal is assumed prior to four decimal digits.For example a number 45 in the above format will be:4500E+02.The program adds the two numbers if the exponent value is same,otherwise issues an error message"Exponent does not match".

Thanks,

Madhumita

They made Z-80 cards for the Apple ][. All it does is make the Apple a dumb terminal for the software you're running on the Z-80, like CP/M. Which CoCo, IIRC, only the CoCo III used the 6809.

The 1050 to PC allows you to hook your Atari disk drive to your pc to copy,
create images, and whatnot. It doesn't allow you to interface to your 8bit.
I would start with sio2pc and use the Ape software from Steve Tucker.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

# 5912. Re: 5 1/2 inch floppy disks

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-01 12:42:52 UTC
From: Mo <momo@atariland.com>
Message-ID: <gTNob.17379$W84.3979@twister.austin.rr.com>
Source record: 18525

The 1050toPC cable is a hundred times more useful to me. It makes quick work of making real floppies to use on your 8 bit. Honestly, I hardly ever use my SIO2PC cable. APE has a utility to use the 1050 to PC (also known as Prosys cable), at least the old DOS version does- I don't know about the windows version. If given a choice, I would stick with the 1050toPC cable.

## 5913. Re: Memory upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-01 17:39:49 UTC
From: rewoolley <rewoolley@alamedanet.net>
Message-ID: <3fa3f54e$0$9404$2c56edd9@news.cablerocket.com>
Source record: 18526

The ramdisk is 256K of the 512K total. The system memory is 128K, used 64K at a time (you can reboot with the old system memory in a protected bank.... allows you to snapshot all of the system RAM). The cartridge, PBI and OS take up the last 128K - pretty wasteful, but it gives you complete control over the code in each of these "ROMs". Actually, the GAL programming can be easily changed to make it just a 512K ramdisk if you want. There are lots of possibilities.

# 5914. Re: Windows based A-8 assembler

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-01 17:46:28 UTC
From: phozz bare <phozz@nowhere.com>
Message-ID: <newscache$vbponh$we2$1@lnews.actcom.co.il>
Source record: 18527

ASSI is here: http://members.aol.com/MacFalkner/atari/assi/index_e.htm
Stay away from it though, it has bugs and errors in the documentation and
the author won't answer my emails.

Does anyone know of a Windows-based 6502 assembler that supports local
labels in the same way that MAE supports them? The rules to support this are
simple: Labels starting with '?' are local. Local labels are valid in the
range between two regular labels. Other assemblers seem to have local labels
but you need to declare local regions explicitly (groan, I don't want to go
over my existing code declaring thousands of regions!).

Basically my goal is to get Ice-T, originally written in MAE, to compile on
my PC and generate an object file that is bit-for-bit identical to the
current version. Why bother, you ask? Dunno, but it's a worthy goal :)

# 5915. Re: Atari 600XL mods

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-01 17:49:39 UTC
From: rewoolley <rewoolley@alamedanet.net>
Message-ID: <3fa3f79c$0$9408$2c56edd9@news.cablerocket.com>
Source record: 18528

The jack solders into the unused section of the board that was designed to hold it. The only alteration you need to make to the computer is to drill a 5/8" hole in the back of the case for access to the jack. You can just add the stock parts to the motherboard or do a custom hack to produce the video signals.

I am not sure that I could find the 600XL that I did....

# 5918. XE Game System

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-02 03:53:25 UTC
From: Docrotcod <rahbart@cox.net>
Message-ID: <Md%ob.18801$5c2.10890@okepread03>
Source record: 18531

Well crap... I just cleaned out my XEGS and opened it up and looked at the insides. Didn't really do anything other than take a peek. Hooked it up. And now it flashes the blue screen with garbage. When it does come up, it just goes to 'ready' and will lock up if you enter a command. It tried to boot off of the disk once and now it won't attempt that. Any ideas? Could I be using the wrong P/S? (I'm just using one I found that powers my 800xl)

Thomas

# 5919. SCRAM

>jeremy

let me also point out that the cable for use with ARFD software and SIO2PC software (in diagnostic mode) - direct hookup of 1050 to PC - is different than the cable used with APE/ProSys - same hookup.

I usually call the first type of cable 1050-2-PC while the latter should be called ProSystem.

Er well,
I do not own an Atari ST nor an Amiga computer (nor a C64). Thus I
cannot send you any ST or amiga graphics. but a well known friend of
mine (Thimo Graef) already used some Dungeon Master and Bard`s Tale
graphics in his (german) RPG "Castle Blackthorne". I can send you a
copy of this game - afaik, thimo converted the C64 and ST graphics into
gr. 9 +11 (256 color, extremely low resolution format on the XL). I
guess the ST and C64 (or any ST or C64 emulator) are able to make
screenshots and save them as GIF, IFF, BMP or other formats. With a good
converter (e.g. apacview to convert GIF into Apac format) one can easily
convert these non-XL formats into any A8 format... greetings, Andreas.

P.S.: E-mail me, if you are interested in a copy of "Castle of
blackthorne"...

http://pvb.free.fr/Atari/Atari_Index.htm

It is a PC (w32 actually) program.
You can manipulate ATR files with it.
It can also read real Atari floppies using 1050-2-PC cable.

I was just thinking back about 20 years ago and I remember going
through the scram listing to figure out how they made the screen shake
back and forth... Once I got that down, it provided no end in
entertainment value, my friend up the street with an 800xl almost
killed me when I had him convinced his brand new atari was broke...

It was a simpler time back then...

I remember Scram pretty well... you need to cool the reactor core by
pulling the three lines up and down.. the idea is to keep everything
running smoothly so you dont get a meltdown. This is not really an
exciting game.

MULE was terrific, and still is. I still enjoy playing it, although playing against 3 bots is far too easy.

# 5933. Atari Emulation HELP needed

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-03 19:56:38 UTC
From: Hans <no_spam@secretdomain.com>
Message-ID: <vqdcnmco79ilba@corp.supernews.com>
Source record: 18546

Hello all. I searched through the postings here and didn't see this one addressed, although I'm sure it has been many times in the past.

I am trying to play Ali Baba and the 40 Thieves (the RPG one, not he Arcade one), but am having trouble booting it. I am familiar with C64 emulation, but not Atari. I have XFormer 2000 and boot it up in 800XL mode just fine, but how do I get the emulator to open the .ATR file?

Should I have unzipped the ATR file? If not, do I need to save it somewhere particular in order to play it?

Any help to this n00b question would be so much appreciated. I have many, many fond memories of playing this game.

ca65 has such labels. The default start character is '@' instead of '?', but
you can change that with the .localchar directive.

Regards

Uz

that's funny you mention "making the screen shake back & forth".
I was always "Deconstructing" programs to find good bits I could use in my
own games.
I don't recall where I picked the "screen shake" from, but I did use it in a
basic game I wrote....
.....ah, fond memories.....

> technique.
>

The 800 can have 64K(1 64K or 2 32K cards). Mine usually has a 32K and a 128K card in it. But like the XL/XE, the top 16K is switched out for the hardware and OS roms. The 16K of ram under this can be used. I have a game that uses it as a small ramdisk for about 26 level data files.

The 130XE has 128K ram, the top 64K is banked(4 * 16K) in normally, though I think that is what you meant.

> but how do I get the emulator to open the .ATR file?

Depends on the emulator. In case for mine (www.math.tu-berlin.de/~thor/atari++)
you'd first need to unzip the file (unless it is a .gz, which can be read
directly without any unzipping), then go into the menu and "insert it" into
the first disk drive. Then perform a couldstart, that's also on the menu.

To get to the menu, press and hold the mouse button. The disk menu is far to
the right. The coldstart is somewhere in the middle.

So long,
Thomas

(posting gets swen virus sent to you.)
Uhm.
I wrote a doc for SCRAM, still have it if anyone wants
it. I think I describe the game well enough to play it, but
I certainly didn't type in the whole instruction book.

What happened to that site that had game solutions?
I lost my urls that I had collected.
It was a really nice site, 100s of solutions/docs. Some
were just describing how to play, others were instructions how to complete
the game, like in text adventures.

But I ramble.

Oh, I got a new game, I wrote. Sorta simple, but can be entertaining. A
two dice game. You try to reach a target score before the computer does.

Hehehe... I haven't swung back to the atari 800 yet, but I have considered some nice things. First off, the garage is coming along nicely. Figure out there might be a good place for the 800.

I picked up a Barco 600 projection unit for $10 at the first Saturday sidewalk sale. I would love to get Star Raiders projected on like a wall. :) However, the projection unit has a nine pin RGB port, and a six connection RGB array. :(

So now I am looking for some way, a rare VCR, something that will convert RGB to A/V. (like the Atari 800 monitor port has).

Really would love to have a whole wall of Star Raiders. I think I have wanted to see that again since it was on a projection television that I first saw the Atari 400 and Star Raiders back in '77. Wow...

# 5944. FS: New+boxed ATARI XL/XE cartridge games

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-06 01:11:09 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0311051711.cb652af@posting.google.com>
Source record: 18455

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide :

$7 1 game surface mail (slow)
$9 1 game air mail (fast)
$14 for a package of up to 15 games as surface mail (slow , 3-8 weeks)
$32 for a package of up to 40 games as surface mail (slow , 3-6 weeks)
$23 for a package of up to 8 games as Air Mail (fast , a few days)
$33 for a package of up to 15 games as Air Mail (fast , a few days)
$48 for a package of up to 40 games as Air Mail (fast , a few days)

Europe : please ask

Please note : Paddles/Joysticks/Keyboard Controllers weigh about 3 times as much as 1 game.

And "Eastern Front" weighs as much as 2 games because of instructions and map , Gato,Star Raiders 2 and Tennis about 1.5* as much as the other games.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias Graef

ulrich_sternaxe@gmx.de or lord-chaos@t-online.de

XEGS carts are the cartridge games in the blue XEGS boxes.They work on ATARI 800 XL , 800 XE , 65 XE , 130 XE and 1200 XL and the XE Gamesystem.

Some require 64K, so they woni¿½t run on the ATARI 800.

If you want to see pictures of the gamesi¿½ boxes,instructions and carts,
please use the links.

Check out this website for instructions on how to use the XFormer 2000
then if you have any questions, send me an email:
<http://www.emulators.com/xformer.htm>. Also note, you may have to
boot up in the 800 mode not the 800xl.

Rergards,
kvan

My dad and I played Prisoner 2 years ago and managed to win. It's actually a pretty well designed adventure game.

Having the docs helps. You can find a scan from the original documentation plus a review on GS WorldView:

http://apple2.org.za/gswv/a2zine/Docs/Prisoner2_docs.txt

## 5948. 130XE

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-06 15:49:05 UTC
From: Docrotcod <rahbart@cox.net>
Message-ID: <K4uqb.944$643.644@okepread03>
Source record: 18461

Picked a couple of 130xe's off of Ebay the other day. One was listed as working and the other listed as not. Pretty much was correct. The working one I had to remove c304 for high speed serial operation and also swap the power switch with the non-working one. The old was was stiff and intermittent. I fired up the second 130xe and it goes straight to self test. Most of the memory test fails. I opened up the unit and removed the RF Shield. The 24947 chip has been apparently replaced. The soldering was really messy. I cleaned it up but I still get the ram errors. Any ideas?

Thomas

## 5949. DSDD diskettes available

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-07 03:24:09 UTC
From: rewoolley <rewoolley@alamedanet.net>
Message-ID: <3fab15cc$0$9404$2c56edd9@news.cablerocket.com>
Source record: 18462

I found a supplier with 5 1/4 DSDD diskettes. I paid $40 including shipping, for 500 disks. They have paper sleeves but otherwise work just fine. They are new - look like gov't surplus - good quality - shrink wrapped 10 to a box. He has many, many more....

"I Do have as many as you need. If you would like to
place an order Call 1-800-400-6634 ask for Parker."

This guy is also on ebay, but is very hard to find.

So, if you want to stock up for the duration, give him a call!

Bob

WMCJ is much better with the Team Tap and multiplayer. And NBA Jam TE is
far better than WMCJ. I haven't played either in awhile...tho Jam was
great 4-player fun and probably the best iteration. I am mostly
nonplussed by basketball overall. But two player NBA Jam on the Genesis
ages ago hooked me on the arcade aspect. Recently I've really been
enjoying 2-player NBA Street 2 on the GC. Mostly just button mashing on
my part but it sure is purty. Thanks for making me think of T2K. I need
to try and pick up a cheap Nuon N501 deck for Xmas so I can finally play
the T3K and Logitech pad I've been hoarding...

I wasn't able to do it myself until I decided to be really nice to them. I supplied all their food and energy and did it quite cheaply.... at first. After a while, I jacked the price as high as I could, while still providing all the food and energy that everyone needed...

It wasn't long before the computer turned everything over to mining and it was rare that anything was used for food and energy.

Then, in about the last 3 rounds or so, I cut the supply. No food, no energy, no production. It is usually the last three rounds that the computer starts to clean up and build themselves up around me, so the deprival of food and energy in these rounds is really really hard on them.

One thing I never did get though, why is it that in the very last round, the computer does no buying or selling at all? Even when the price is outrageously high.

Subject: 0.1) Table of contents

0.1) Table of contents

The Computers
1.1) What is an Atari 8-bit computer?
1.2) What is the Atari 400?
1.3) What is the Atari 800?
1.4) What is the Atari 1200XL?
1.5) What is the Atari 600XL?
1.6) What is the Atari 800XL?
1.7) What is the Atari 65XE?
1.8) What is the Atari 130XE?
1.9) What is the Atari 800XE?
1.10) What is the Atari XE Game System?
1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?
1.12) What is the internal layout of the 8-bit Atari?
1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?
1.14) What are the pinouts for the various ports on the Atari?

Video Display
2.1) What video display devices can I use with my Atari?

Mass Storage
3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?
3.2) What other cassette recorders can I use with my Atari?
3.3) How do I run a program from cassette?

3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?
3.5) What other floppy disk drives can I use with my Atari?
3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?
3.7) How can I use a hard drive with my 8-bit Atari?

Printers
4.1) What are the Atari 820, 822, and 825 Printers?
4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?
4.3) What are the Atari XMM801 and XDM121 Printers?
4.4) What other printers can I use with my Atari?

MODEMs
5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?
5.2) What other modems can I use with my Atari?

More hardware
6.1) What is the Atari 850 Interface Module?
6.2) What is the Atari XEP80 Interface Module?
6.3) What accessories did Atari produce for their 8-bit computers?
6.4) What "vaporware" computers/peripherals were never released?
6.5) What are the power requirements for my Atari components?
6.6) What graphic tablets were produced for the Atari?
6.7) What lightpens were produced for the Atari?
6.8) What lightguns were produced for the Atari?
6.9) What paddles were produced for the Atari?
6.10) What voice/sound synthesis hardware was produced for the Atari?
6.11) What sound-digitizers/samplers were produced for the Atari?
6.12) What sound-enhancement upgrades were produced for the Atari?
6.13) What MIDI enhancements are there for the Atari?
6.14) What graphics enhancements are there for the Atari?
6.15) What types of memory upgrades are there for the Atari?
6.16) What networking hardware is there for the Atari?
6.17) Can I attach an ISA card to the Atari?

Core software: OS, BASIC, DOS, Modem handlers
7.1) What versions of the Atari Operating System (OS) are there?
7.2) What is the ATASCII character set?
7.3) What is Atari BASIC?
7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?
7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?
7.6) How do I modify Atari DOS to support more than two drives?
7.7) Are there Graphical User Interfaces (GUIs) for the Atari?
7.8) What should I know about modem device handlers?

Software
8.1) What programming languages are available for the Atari?
8.2) What cartridges were released for the Right Slot of the 800?
8.3) What games support 4 or more simultaneous players?
8.4) What programs run only on the 400 and 800 models, and why?
8.5) What programs make use of the Light Gun or a light pen?
8.6) What programs have a track ball mode or support a mouse?
8.7) What programs have a paddle(s) or Koala Pad mode?

8.8) What programs have a CX85 Numerical Keypad mode?
8.9) What programs have a Touch tablet mode?
8.10) What kinds of RAMdisks can be set up on the Atari?
8.11) What programs support a RAMdisk?
8.12) What programs require a RAMdisk?
8.13) What voice/sound synthesis software is there for the Atari?
8.14) What programs support stereo and upgraded sound?
8.15) What games support online action via modem?
8.16) What programs support Atari computer networking?

Working with Atari files: Compression, File formats, Copying
9.1) How can I work with .arc files on my 8-bit Atari?
9.2) What file formats for entire disks/tapes/cartridges are there?
9.3) How can I copy my copy-protected Atari software?

Interoperating with "modern" computers
10.1) What programs can log in to other computers via modem?
10.2) What programs can I use to host a BBS on the Atari?
10.3) How can I read/write Atari disks on an MS-DOS PC?
10.4) How can I read/write MS-DOS PC disks on my Atari?
10.5) How do I transfer files using a null modem cable?
10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?
10.7) How can my Atari use my PC's HD, printer and modem using APE?
10.8) How can I connect my 1050 drive to my PC with the APE ProSystem?
10.9) What about interoperating with the Apple Macintosh?
10.10) Are there 8-bit Atari tools for the Commodore Amiga?

Timeline
11.1) How did Atari get its name?
11.2) What is the History of Atari?

---

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace most directly with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer, among others. Of these, the 8-bit Atari is most similar to the Commodore 64.

In marketing their computers to the public, Atari always had to contend with their company history and reputation as a maker of video games. While the 8-bit Atari computers in their heyday were technically quite comparable if not superior in the worlds of home and business personal computing, they also live up to the name "Atari" with a huge library of video games which were often outstanding for their time.

The 8-bit Atari computers do not use the same cartridges or floppy disks as any other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

The 5200 SuperSystem is actually nearly identical to the 8-bit computers internally, yet cartridges for the 5200 and the 8-bit computers cannot be exchanged, primarly due to the physically different cartridge ports.

Here are some of the performance specifications of the 8-bit Atari computers:

(Some of the rest of this section by Bill Kendrick)

CPU: 6502 (MOS Technology)

CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
non-NTSC machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:

| ANTIC Mode # | CIO/BASIC Graphics # | Type | Display Resolution (full screen) | Number of Colors |
|---|---|---|---|---|
| 2 | 0 | Char | 40 x 24 | 1 * |
| 3 | - | Char | 40 x 19 | 1 * |
| 4 | 12 ++ | Char | 40 x 24 | 5 |
| 5 | 13 ++ | Char | 40 x 12 | 5 |
| 6 | 1 | Char | 20 x 24 | 5 |
| 7 | 2 | Char | 20 x 12 | 5 |
| 8 | 3 | Map | 40 x 24 | 4 |
| 9 | 4 | Map | 80 x 48 | 2 |
| A | 5 | Map | 80 x 48 | 4 |
| B | 6 | Map | 160 x 96 | 2 |
| C | 14 ++ | Map | 160 x 192 | 2 |
| D | 7 | Map | 160 x 96 | 4 |
| E | 15 ++ | Map | 160 x 192 | 4 |
| F | 8 | Map | 320 x 192 | 1 * |
| F | 9 + | Map | 80 x 192 | 1 ** |
| F | 10 + | Map | 80 x 192 | 9 |
| F | 11 + | Map | 80 x 192 | 16 *** |

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile

graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS: (byte height and OR corrections from Piotr Fusik)
Four 8-bit wide, 120 or 240 byte high single color players, and four 2-bit wide, 120 or 240 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to OR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

---

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two. The only 8-bit Atari with a membrane keyboard rather than a full-stroke keyboard. One of the few 8-bit Ataris lacking a composite monitor port. Originally released with just 8K RAM, but most were sold with 16K RAM. Atari sold the Atari 400 48K RAM Expansion Kit, which required a little soldering, to dealers only.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer".

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

------------------------------

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

------------------------------

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

The 1200XL was discontinued in 1983.

------------------------------

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems

offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Rarely, some late-model 600XLs were sold with 64K RAM. These may have only appeared in Canada. The box had a round gold foil sticker reading:
"64k Memory -- Now with a full 64k of memory built-in."

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The North American/NTSC 600XL does not include a composite monitor port;
The European/PAL 600XL includes the monitor port, but this lacks the chroma video signal.

The 600XL was discontinued in 1985.

---

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Rev. B, or late models with Rev. C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal (exeception next paragraph).

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (the XE design) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

---

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. Many European (PAL) 65XE's include the ECI port, but no North American (NTSC) 65XE's include the ECI port. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

------------------------------

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

------------------------------

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE, including the ECI port. The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

------------------------------

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE. It was packaged with the Light Gun, and the Flight Simulator II and Bug Hunt cartridges.

Keyboard connected/no cartridge:
boots to Atari BASIC
Keyboard connected/no cartridge/[Select] held down at startup:
boots to Missile Command
No keyboard connected/no cartridge:
boots to Missile Command
No keyboard connected/no cartridge/[Select] held down at startup:
boots from disk drive
No keyboard connected/no cartridge/[Select]+[Start] held down at startup:
boots from tape drive

[Option] held down at startup = BASIC on
[Option] not pressed at startup = BASIC off
(opposite from all other XL/XE machines)

Andreas Magenheimer writes:
Tip: The confused XEGS Atarian should use the XEGS manager by Mat*Rat
(Mathew Ratcliff). This assumes one knows at least how to boot a disk
with the XEGS...

James Bradford offers:
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and
Missile Command on it.

The XE Game System was discontinued in 1992.

---

Subject: 1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

Some of the following text is taken from De Re Atari (Atari#APX-90008), a book published by Atari through the Atari Program Exchange (APX) and copyright 1982 by Chris Crawford, et al. See http://www.atariarchives.org/dere/ where the full text of De Re Atari is now available online.

The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a PIA. However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

6502 Central Processing Unit (CPU)
====
While the 400/800 models contain a generic 6502B CPU (a faster version of the original 6502A microprocessor), all of the XL/XE models contain Atari's customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To allow them to coexist, ANTIC must shut off the 6502, a process called DMA. The 6502B supports DMA, but in Atari's implementation, it required 4 chips. The 6502C has an extra line called HALT. It is controlled by ANTIC which uses it whenever it needs the data/address bus. The HALT line is on pin 35 of the Atari 6502C and must be pulled high for the chip to work.

ANTIC
=====
ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves

this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

Frank Schuster writes (6/1/02):
the patent for the ANTIC processor:

U.S. Patent 4,296,476 October 20, 1981 for a "Data processing system with programmable graphics generator". Inventors listed: Steven T. Mayer; Jay G. Miner; Douglas G. Neubauer; Joseph C. Decuir

CTIA/GTIA
=========
CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missile graphics, and collision detection.

Early 400/800 models included CTIA, later 400/800 models and all later 8-bit Ataris included GTIA.

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifact in blue/green, GTIA 400/800s artifact in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:
I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible.

Frank Schuster writes (6/1/02):
..here a summary of Atari patents covering technical parts of the GTIA / CTIA or at least the steps of development to it. I found them by following the references made in the "newest" patent 4,324,401 which at the end stands for the GTIA.

U.S. Patent 4,324,401 April 13, 1982 for a "Method and system for generating moving objects on a video display screen". Inventors listed: David R. Stubben, Lyle V. Rains. References: 4,116,444; 4,107,665

U.S. Patent 4,189,728 February 19, 1980 for an "Apparatus for generating a plurality of moving objects on a video display screen utilizing associative memory". Inventor listed: David R. Stubben. References: 4,116,444; 4,045,789

U.S. Patent 4,116,444 September 26, 1978 for a "Method for generating a plurality of moving objects on a video display screen". Inventors listed: Steven T. Mayer; Ronald E. Milner. References: 4,016,362; 3,793,483

U.S. Patent 4,107,665 August 15, 1978 for an "Apparatus for continuous variation of object size on a raster type video screen". Inventors listed: Steven T. Mayer; Ronald E. Milner

U.S. Patent 4,045,789 August 30, 1977 for a "Animated video image display system and method". Inventor listed: Stephen D. Bristow. References: 3,793,483

U.S. Patent 4,016,362 April 5, 1977 for a "Multiple image positioning control system and method". Inventors listed: Stephen D. Bristow; Steven T. Mayer. References: 3,793,483

U.S. Patent 3,793,483 February 19, 1974 for a "Video Image Control System for Amusement Device". Inventor listed: Nolan K. Bushnell

POKEY
=====
POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The USPTO granted U.S. Patent 4,314,236 to Atari on February 2, 1982 for an "Apparatus for producing a plurality of audio sound effects" - POKEY. Inventors listed: Steven T. Mayer, Ronald E. Milner

FREDDIE
=======
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS

goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800XL. The small chip near FREDDIE does all the bank selection. CO25953. One line from FREDDIE, Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. A pin for each bank. If I remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800XL work just like a 130XE with this chip since Ras (Cas?) is required by ALL dynamic RAM.

======
Technical data sheets and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Division's release of this data. See the TIFF scans:
http://www.atari-history.com/articles.html
Keith Howell has converted the hi-res TIFFs into clean HTML:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL.htm

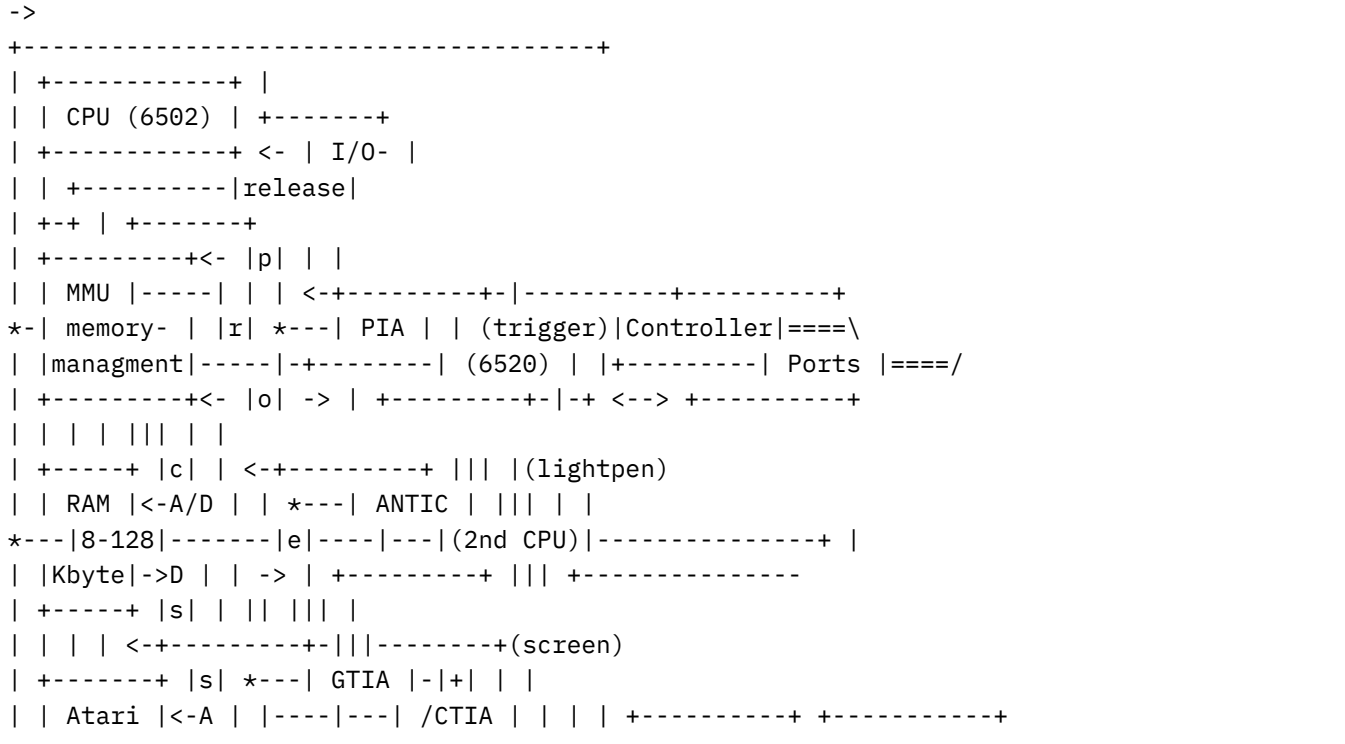
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.



- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos ) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/many PAL 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter, Jindroush

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western Europe, several South American countries, some Middle East and Asian countries, several African countries, Australia, New Zealand, and other Pacific island countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC machines with the faster 60Hz refresh frequency. So PAL demos and games that won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly
on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the
screen refresh rate to 50Hz, allowing most of the PAL-only European software
to run on a North American NTSC Atari. However, make sure your display device
can support a 50Hz PAL signal first! North American Atari users can also
obtain and use real European PAL Atari machines, with the same caveat
concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will (almost) always work
on PAL machines (Europe), but software designed on PAL machines won't
necessarily work on NTSC machines.

Jindroush contributes: (2/26/02)
Could there be a program which runs on NTSC Atari and not on PAL Atari?
Yes, if it uses some precise timing copy protection (probably based on
vblank timing). Examples of these are Transylvania and The Quest by
Penguin Software.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the XL computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

And on 10/16/03 Thomas Richter answered a related question this way:
>> Note that it's typically not too hard to get an NTSC Atari to run in PAL
>> by just swapping out the ANTIC chip.
>>
>> Unfortunately, some demos actually check the OS ROM for a particular
>> value to see if it's a PAL machine or not, and then refuse to run if
>> they are. *grumble* I'd rather have a warning than a refusal. :^P

> As far as I am aware, the only value to tell a PAL from a NTSC machine is in
> GTIA. Maybe swap that one as well and see what you get

Absolutey correct, GTIA keeps the PAL/NTSC register and the Os rom reads it
from there. However, besides the GTIA PAL and NTSC machines differ in other
aspects. For example, on PAL machines an additional oscillator of 5/4 of the
main frequency is present to generate the color frequencies needed to drive
GTIA. There is no such circuit in NTSC Ataris. Besides, this factor of 5/4 is
also the reason why you don't get "artifacted colors" on PAL machines (or,
at least, not very good ones.)

Subject: 2.1) What video display devices can I use with my Atari?

Contributors to channel output variations list:
Jon Levy, Rene de Bie, Sysop Fox-1

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal, either one VHF channel, or two VHF channels selectable by a switch on the computer. Variations depend primarily on the part of the world that the particular version of the computer was desgined for.

Most North American computers: VHF channels 2-3 switch-selectable.
channels 3-4 switch selectable also reported
European computers: VHF channels 3-4 switch-selectable,

or no switch (what channel?) both reported
UK computers: VHF channel 36, no switch,
or channels 38-39 switch selectable both reported
Australian computers: VHF channel 1 (400/800: channels 1-2 selectable)

Any further clarifications would be appreciated!

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from
the Atari, input connector(s) for your TV attenna and/or cable TV
company, and 75- and/or 300-ohm VHF output connector(s) for connection to
the VHF input on the television. (Radio Shack carries a suitable TV
Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:
separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack,
providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL(most) and 1200XL lacks the separate
chrominance signal. (But it exists internally, and can be restored to the
monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ
list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one
end, and two RCA male connectors on the other end. One of the RCA connectors
will carry the monophonic sound signal, and the other will carry the composite
video signal. Color composite monitors were common in the mid-80's, but these
days many televisions have an RCA female composite video input connector which
works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the
second RCA connector is not the composite video signal, but the composite
luminance signal. These cables are for use with monochrome composite video
monitors (usually green or amber).

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output
end, carrying the sound signal, the composite luminance signal, and the
composite chrominance signal. Only the best composite monitors include
separate chrominance and luminance inputs. Commodore produced many fine
monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a
bit more of a problem. The composite and audio connectors are standard
RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN
connector for chroma/luma connections, like the 1902A, while some used
standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902
shares the same slightly rounded front case design as the 1080 and 2002,
while the 1902A is has a rather square case design, and was manufactured
by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts
out comprise what the world has since come to call Y/C video or S-video.
S-video connectors are normally Mini4. It is possible to build a cable, or
purchase several adapters, that can allow you to utilize the separate Y/C
signals generated by the Atari with a television (or other display device)
that provides a standard S-video Mini4 input jack. This is the ultimate
display option for the 8-bit Atari. Clarence Dyson has a nice page about
such a project at http://www.wolfpup.net/atari/svideo.html .

Adapters also exist that will take in composite video or s-video, and output a
conversion of the signal as a standard VGA video signal. These are often
known as a "VGA converter" or "Scan doubler." With such a device, the 8-bit
Atari can be used with a standard PC VGA monitor. One such adapter is the
Cheese Video Box, http://www.avtoolbox.com/vd-660.htm . An earlier popular
device was the JAM!! from AIMS Lab.

SCART - an acronym for Syndicat des Constructeurs d'Appareils Radiorecepteurs
et Televiseurs - is a 21-pin universal connecting cable/socket system used for
audio/video components in Europe. The cables transmit RGB, composite video,
S-Video, mono and stereo sound. SCART, which is also known as PERITEL,
EURO AV BUS and EUROCONECTOR, is common throughout Europe, particularly in
France, England, Germany, Switzerland, and Scandinavia. SCART is also very
popular in the Russian Audio Video market. It is possible to interface the
Atari's composite video signal, along with the audio signal, through a SCART
connector, though there have been few reports of people actually doing this.

Keith Howell has a nice page on some of these topics:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

---

Subject: 3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs
and data on cassette tape. In addition to the digital track that stores
computer data, a second audio track is provided to play music or voice
as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- built-in SIO cable - must end SIO daisy chain
- power - plugs directly into wall (most versions)
- "410P" version (rare). Karl Heller writes:
"It came in the white 410 box with an Atari yellow/orange paper slip
stating which power supply to use with it."

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
- has a built-in SIO cable and one SIO port

XC12 Program Recorder
- built-in SIO cable - must end SIO daisy chain
- Information on the Turbo 6000 Baud Interface and the Chaos Loader:
http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

---

Subject: 3.2) What other cassette recorders can I use with my Atari?

Firstly Atari themselves put out several models beyond the 410/1010/XC11/XC12,
generally only known in eastern Europe:

XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

For more information on the Turbo 2000 (T2000) and SuperTurbo modifications to
Atari program recorders, with speeds up 9600 baud, see
http://jindroush.atari.org

Unlike other microcomputer systems of the time, it was very unusual to use
anything but Atari brand program cassette recorders. One third-party product
released was the:

Compu-Mate, by General Electric (GE, G.E.)
Includes external interface module, a power cord/adapter, and SIO cable.
No second SIO port - must be at end of SIO chain.

---

Subject: 3.3) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the
program was saved, and whether you want to run the program or just load
it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

---

Subject: 3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?

Section includes contributions by Andreas Magenheimer, TXG.

The Atari Disk Drives provide storage and retrieval of programs
and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. One mode of operation:
1) Single-Sided, Single-Density--
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.

The 810 includes a 6507 microprocessor.
Shipped with DOS 1 (very early) or DOS 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html

==> Atari 815 Dual Disk Drive --- dual 5.25" floppy disk drives in one unit
Were produced (all hand-built), but are very rare. One mode of operation.
Per drive:
1) Single-Sided, Double-Density--
MFM 40 tracks x 18 sectors/track x 256 bytes/sector = 180K capacity
19.2Kbps transfer rate. 288RPM.
The 815 includes a 6507 microprocessor.
Shipped with DOS 2.0D
MPI mechanism version- push button door opening for disk access
Tandon mechanism version- lift door, like a garage door disk access
accessories from Atari:
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)
Stephen Knox writes (12/28/02):
I believe the story on the 815s was Atari didn't want to release them due to
severe QA problems with the drive but they had so many preorders they had to
release something. I think they filled the preorders and then cancelled the
model - Most of them got returned due to problems.

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability. Two modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because
it is not true double-density--
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS 2.0S, DOS 3, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050 (all add a true SSDD 180K capability):
US Doubler (ICD) SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,

Happy Backup. also read/write 180K 5.25" MS-DOS floppies
I.S. Plate (Innovated Software) SS SD/ED/DD Ultra/Warp (USD/Happy clone)
Hyper Drive (Chaos! Computers) SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Super Archiver (CSS) SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Super Archiver II(CSS)SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050/Mini-Speedy SS SD/ED/DD Warp Speed 78,000Baud (Happy clone),
8kbytes
(Klaus Peters) Track/Cache buffer, built-in DOS and/or HSS-Copy;
Super Speedy 1050 SS SD/ED/DD Warp Speed 96,000Baud (Happy clone),192K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps
Engl-Turbo-1050 SS SD/ED/DD Turbo Speed approx. 70,000 Baud (uses
(german Turbo) Sector skewing that differs from USDoubler)

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive. Four modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Enhanced-Density, 128K, 1050 compatible
3) Single-Sided, Double-Density, 180K, Percom & other 3rd parties compatible
4) Double-Sided, Double-Density--
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, when compared to a two-sided "flippy" disk with SSDD 180K format on each side
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM. Since all other Atari-specific drives run at 288RPM, this results in rare compatibility issues. Specifically, these commercial disks do not load in, and can be damaged by, the XF551:
- Flight Simulator II (subLOGIC)
- Blue Max (Synapse)
- Bank Street Writer (Broderbund). Conflicting reports about this one.
8040 cpu + external ROM or 8050 cpu with internal ROM
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1

Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see
http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see
http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see
http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see
http://www.nleaudio.com/css/products/XFupdate.htm
Hyper-XF-OS--avaiable for 5.25" or 3.5" floppy versions; uses sector skewing
and UltraSpeed (but no track buffer!); can use disk partitions
(2 on 5.25", 4 partitions on 3.5") with mixed Densities (S/E/D)
or standard 360kbytes (5.25") / 720kbytes (3.5"); can
theoretically read/write ST/PC 720k disks (software is missing!)
OS created by Stefan Dorndorf/Germany;
XF-Speedy--replaces the 8040 CPU with a 65C02 + ROM + Memory

---

Subject: 3.5) What other floppy disk drives can I use with my Atari?

Major contributors to this section: Glenn M. Saunders, Tomasz M. Tatar,
James Bradford, Konrad M. Kokoszkiewicz, Don Schoengarth, Andreas Magenheimer

SS=Single-Sided SD=Single-Density, 90K/disk side
DS=Double-Sided ED=Enhanced-Density, 128K/disk side
DD=Double-Density, 180K/disk side

Printer port=has a standard DB25 parallel printer port,+ maybe a print buffer
Master=includes drive controller, can add additional,non-Atari-specific drives

Top transfer rate=19.2Kbps unless stated otherwise

Floppy disk drives designed for the 8-bit Atari computers:
Atari 810 SS SD
Atari 1050 SS SD/ED
Atari XF551 DS SD/ED/DD, 38.4Kbps burst mode
Access Unlimited ATAR88-1 SS SD master
Access Unlimited ATAR40-1 SS SD/DD master
Amdek AMDC I SS SD/DD uses flippy Amdisk III 3" disk/carts,printer
port,master

Amdek AMDC II SS SD/DD dual drives, printer port, master
AS SN-360 DS SD/ED/DD
Astra 1620 SS SD/DD dual drives
Astra 2001 SS SD/DD dual drives
Astra Big-D DS SD/DD dual drives
Astra The One DS SD/DD, printer port
B&C 810 SS SD, optional Happy Warp Speed 52Kbps
Concorde C-221M SS SD/DD master
Concorde C-222M DS SD/DD master
CSS Floppy Board, for the Black Box, master, support PC 720K and 1.44MB 3.5"
drives, support PC 1.2MB and 360kB 5.25" drives,
also read/write 5.25" and 3.5" MS-DOS disks
see: http://www.nleaudio.com/css/products/floppy.htm
High-Density Disk Interface (HDI) a PCB master,connect up to 4 standard drives
Indus GT SS SD/ED/DD, Synchromesh mode usable with SpartaDOS X
and DOS XL only. 72Kbps under SpartaDOS X, 37Kbps under DOS XL. Z-80 cpu
RAM-Charger--expansion card contains 64K RAM + software, for CP/M support
KARIN MAXI DS SD/ED/DD/QD
L.E. Systems LEDS5-01 SS SD/DD master, 134.4Kbps, 800 only
CP/M expansion: 4MHz Z80, 64K RAM

Subject: 3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I
mean you can't use high density disks. They must be double density to use
with the 1050. Almost all double density 5 1/4" disks have a hub ring, high
density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the
type of oxide coating used on the high density floppy media; they cannot write
reliably to them. The hub ring has just become a sort of marker to distinguish
the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the
really premium brands offered hubs to prevent slippage and out of round
problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub rings became common on good disks and eventually became standard down to include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (= magnetizability) to get more bits in a smaller space and suitable electronics to do it. These disks were produced hubless; was it a differentiating label or just unnecessary because of stronger mylar construction? Anyone?

---

Subject: 3.7) How can I use a hard drive with my 8-bit Atari?

Atari never produced hard drives for the 8-bit Atari, but a variety of options have been produced over the years. No common DOS version was written with drives the size of hard drives in mind, and very few 8-bit Atari users have owned hard drives for the Atari. Yet, if you're serious about it, a hard drive can make a tremendous addition to your system!

A couple of these options are hard drives designed specifically for the 8-bit Atari computers; the rest are interfaces designed to let you attach an industry standard SASI, SCSI, or IDE type hard drive. Customized software (OS, DOS) is often involved as well.

Larry White contributed to some of these descriptions.
Additional Corvus info from an eBay auction by Ben Corr, 7/03.

==> Corvus hard drive (5MB, 10MB, or 20MB)
Attaches via joystick ports 3 & 4 on the Atari 800 only.

-- Corvus Integrator Board - alows access to the Corvus Disc without the Corvus software, so that any DOS that uses standard SIO calls will work.

-- Corvus Multiplexer - used to network up to 8 Ataris to one Corvus Drive

- Corvus Mirror card - back up the drive's contents onto video tape

==> SupraDrive Atari Hard Disk, by Supra, later K-Products. 10MB or 20MB.
includes external Hard Disk Interface
Some limitations on drive type and size and total number of drives in sys.
Attaches via PBI, or ECI with adapter.
See: http://www.atarimagazines.com/v5n6/Supradrivefor8Bit.html
Maybe still available from Bob Klaas?

==> BTL Hard Disk System
BTL 2001 Connector for 600XL/800XL PBI
BTL 2002 Connector for 130XE/800XE/65XE ECI
BTL 2004 SASI Hard Disk Adapter
See: http://www.atarimagazines.com/v5n12/BTLHardDisk.html

==> Multi I/O (MIO) interface, by ICD. Includes:
- Parallel printer interface
- Serial interface, for modem or serial printer. will handle 19.2Kbps
- 256K or 1 MB RAM, for RAMdisk or printer spooler
- SASI/SCSI interface, supports up to 8 controllers.

Limited to drives with 256-byte sectors.
Attaches via PBI, or ECI with adapter.

==> CSS Black Box interface
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
PBI/ECI device. Available: http://www.nleaudio.com/css/products/black.htm

==> SmartIDE project by Bob Woolley
Uses 256 of the normal 512 byte sectors. Point-to-point wiring project.
Articles and software at http://www.wolfpup.net/atari/atari.html

==> IDE Hard Drive Interface 1.0
By Konrad M. Kokoszkiewicz (Draco) and Jacek Zuk
PBI device. Logical sector length: 256 or 512 bytes
Availability???

==> Fine Tooned Engineering (FTe) Multi I/O II (MIO II) interface
An IDE interface. Several exist, but it was never really released

==> msc-IDE Controller
created by Steve Birmanns and Matthias Belitz
* real device for the parallel-port (PBI/ECI) of the Atari XL/XE
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* software partially supports CD-ROM and ZIP drives.
Sold out.
http://www.birmanns.de/atari/

==> Gary Morton's BadSector"A" Project
Wants to connect his IDE drive to the SIO bus.
http://www.alma.demon.co.uk/Atari/AtariProjects.html

==> MyIDE interface and software by Mr.Atari, Sijmen Schouten
Point-to-point wiring project. Different units for 800 and XL, including a
cartridge version for the XL.
http://home.wanadoo.nl/mr.atari/

==> SIO2IDE, by Marek Mikolajewski (MMSoft)
The SIO2IDE is a simple interface that allows you to attach any IDE Disk
Drive to your 8-bit Atari computer. Latest interface version has the
following main features:

* ATARI side:
- uses standard Atari SIO at a speed of 19200 baud
- works with Atari High Speed SIO (US and Happy) at a speed of 52000 baud
- emulates Atari disks D1: to D8:

- can be used with any Atari DOS and OS
- can be used without any problems with other SIO devices (disk drivers, printers, modems, SIO2PC, second SIO2IDE etc)
- can be easy installed inside your Atari with 2.5' laptop HD
- is easy to configure via special fdisk.com utility software (changing disks sequence and active directory)
* IDE device side:
- all IDE ATA/ATAPI devices can be used: Disk Drives (2.5' and 3.5'), CD-ROMs, Compact Flash cards etc.
- supports PC file systems, FAT16 and FAT32
- supports CD file system, ISO9660
- supports ATR disk images (SD, DD up to 16MB)
- supports directory change (multiconfig)
- is easy to configure, many text configuration files (sio2ide.cfg) can be stored in different directories
- disk configuration can be checked by special checkfs.exe PC utility
NOTE: checkfs.exe does NOT work with HDD connected via USB port
- standard disk utilities can be used (defrag.exe, scandisk.exe etc)
* USB port side:
- interface works as Mass Storage Class device (removable drive)
- no drivers are needed for Windows 2K, ME, XP
- driver for Win98 is included in this SIO2IDE package

http://www.atari.cuprum.com.pl/sio2ide.htm

==> Nathan Hartwell's IDE projects

---

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

The following printers were produced by Atari and styled to match the 400/800 computers.

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer: ( = Trendcom Model 100 )
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer ( = Centronics 737 )
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch

monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

---

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

The following printers were produced by Atari and styled to match the XL series computers.

Atari 1020 Color Printer:
( = Commodore 1520 / Oric MCP40 / Tandy/Radio Shack CGP-115 /...; made by ALPS)
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included

Atari 1025 80-Column Printer: ( = Okidata ML80 )
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: ( = Mannesmann Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer ( by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe & Canada (not USA)
- Rich_N_Feymus says:
I think its a SEIKOSHA GP500, but not 100% sure. However, the Commodore MPS-801 ribbons should be much easier to find.
- The Tandy DMP 110 is another model reported to be the same as the 1029.

---

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

The following printers were produced by Atari and styled to match the XE series computers.

Atari XMM801 Printer: ( = SHINWA CP80 )
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

---

Subject: 4.4) What other printers can I use with my Atari?

Some third-party printers were marketed for use with the Atari 8-bit computers:

Alphacom 42 + Atari interface cartridge
- requires 850 Interface or equivalent
- thermal
- 4 1/2" width paper
- supports complete ATASCII character set

Axiom AT-100 / Seikosha AT-100 / Seikosha GP-100A Graphic Printer
- built-in Atari interface, cable and connector, 2nd SIO port for daisy-chain
- dot matrix
- early model 30-cps, later version 50 cps
- Graph-AX graphics software package

Axiom GP-550AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- dot matrix
- 86 cps draft, 43 cps NLQ
- Graph-AX graphics software package

Axiom GP-700AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- 4 hammer print heads, 4-color ribbon cartridge
- 25 colors
- 50 cps
- Graph-AX graphics software package

Epson HomeWriter 10
- plug-in cartridge interface for the Atari
- 80 column dot-matrix printer
- draft quality printing at 100 cps and near letter quality at 16 cps

General Electric GE 3-8100 / TXP 1000
- GE Printer Interface Module for Atari
- dot-matrix
- 50 cps draft, 25 cps NLQ

Okidata Okimate 10 Personal Color Printer
- available Plug 'n Print Interface for Atari
- a thermal printer.
- single-sheet or tractor-feed paper.
- 26 colors
- 240 words per minutes

Beyond the above printer models, most any "industry-standard" line printer can work well with the Atari. For many years, most printers marketed for home use could be classified into one of two categories: parallel or serial interface. Parallel line printers are much more commonly used than serial line printers, with the Epson MX/FX/LX series defining the market.

The most common way to use an industry standard printer with the Atari has been to attach it through the 15-pin 8-bit parallel port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the 850's parallel port is DB15, where the PC world ended-up standardizing on a DB25 configuration. So you need to find or build a cable that provides the DB15 connector for the Atari end (and Centronics-type parallel connector on the printer end) when attaching a standard parallel printer to the Atari through an Atari 850 or equivalent.

Many 3rd-party disk drives for the Atari (along with the XEP80 Interface Module) do include a DB25 parallel printer port, rendering the need for an Atari-specific printer cable unnecessary.

The Atari 850 Interface Module and equivalents also provide standard DB9 serial RS232C ports, permitting use of standard serial line printers with the Atari. But this is much less common than parallel, both in the Atari world and in the industry at large.

Some folks have connected more modern inkjet and laser printers with parallel connections to the 8-bit Atari with success. Graphics printouts from the Atari may be less than ideal (look for a printer with an Epson MX/FX/LX printer series emulation mode), but these types of printers should work fine for plain text output if they can handle simple line print jobs. Anyone want to contribute their experiences to be included here?

Bob Woolley wrote on Sun, 14 Apr 2002:
I use HP LaserJet 4Ps on my Ataris. They are one of the last front panel selectable cheap printers - from which you can select your default fonts, etc. The newer laser printers can only set fonts and operating modes thru the interface, not impossible, but not as easy as selecting on the panel. This does allow you to print just about any point size of the internal fonts in the printer on your Atari.

Either way, you really have to do a little work to get properly formatted output from a word processor. I have managed to use the proportional font setting with AtariWriter and printer driver creation utilities to get good

results.

Mathy van Nisselroy provides an AtariWriter printer driver for the HP LaserJet
here: http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm

Modern printers designed for home markets now tend to provide USB connectors.

---

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into
acoustic tones that can be sent and received, from modem to modem, via
standard telephone lines.

Atari produced several modems for use with the 8-bit Atari computers:

Atari 830 Acoustic Modem: ( = Novation 'CAT' )
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

---

Subject: 5.2) What other modems can I use with my Atari?

Some third-party modems were marketed for use with the Atari 8-bit
computers:

==> Microconnection, by Microperipheral Corp.
300 bps, Bell 103 compatible, T-SMART software, pulse dialing (not touch tone)

Four versions:
buss-decoding version does not require 850 Interface or equivalent, includes
DB25 parallel printer interface, with or without autodial
Plain version requires 850 Interface or equivalent, with or without autodial
and autoanswer

==> MPP-1000C, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Terminal cartridge

==> MPP-1000E, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Term software
From: "Steven J Tucker" Sun, 13 Jan 2002 16:14:38 -0500
The 1000E..had this strange problem in that it could never hang up the phone

==> MPP-1200A, by Microbits Peripheral Products
Released? Vaporware?
1200 bps, joystick port 2

==> 300 AT, by Supra (same as MPP-1000E)
300 baud, joystick port 2, Smart Term software

==> 1200 AT, by Supra
1200 baud, Hayes compatible, connects to SIO via SupraVerter/R-Verter cable,
Smart Terminal software

==> Volksmodem, by Anchor Automation
300 baud, 'F' Cable permits connection to joystick port 2

==> Q-MODEM, by Quantum Microsystems
300 baud, two SIO connectors, QuanTerm disk or cartridge

Beyond the above modem models, most any "industry-standard" external serial modem can work well with the Atari. These have been commonly sold for PCs for many years. The Hayes Smartmodem more or less defined the market for these, initially.

One common way to use an industry standard external serial modem with the Atari is to connect it to the SIO port via an Advanced Interface Devices (A.I.D., later Supra) R-Verter Serial Bus Modem Adapter cable, or equivalent.

The other common way to use an industry standard external serial modem with the Atari is to attach it through the 9-pin RS232C serial port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the serial port on the 850 is DB9 female, where the PC world ended up standardizing on a DB9 male connector for this purpose. But gender converters are readily available.

For using modems at speeds of 2400 bps and up with the Atari, it will be useful to have an understanding of data flow control. Here is a definition of flow control from www.modems.com:

Often, one modem in a connection is capable of sending data much faster than the other can receive. Flow control allows the receiving modem to tell the other to pause while it catches up. Flow control exists as either software,

or XON/XOFF, flow control, or hardware (RTS/CTS) flow control. With software flow control, when a modem needs to tell the other to pause, it sends a certain character, usually Control-S. When it is ready to resume, it sends a different character, such as Control-Q. Software flow control's only advantage is that it can use a serial cable with only three wires. Since software flow control regulates transmissions by sending certain characters, line noise could generate the character commanding a pause, thus hanging the transfer until the proper character (such as Control-Q) is sent. Also, binary files must never be sent using software flow control, as binary files can contain the control characters. Hardware, or RTS/CTS, flow control uses wires in the modem cable or, in the case of internal modems, hardware in the modem. This is faster and much more reliable than software flow control.

Some 2400 bps modems, and probably all modems with 9600 bps speed capabilities and up, normally use V.42 standard error correction and V.42bis standard data compression. But V.42 requires either software or hardware flow control, and V.42bis requires hardware flow control (and V.42 error correction).

Hardware flow control is not available with the Atari 850's serial ports.

As a result, just before dialing out with your Atari telecom software, it's usually desirable, if not necessary, to disable your modem's flow control.

The Hayes modem command to disable flow control looks like:
AT&K0

The top speed of the Atari 850's serial ports is 9600 bps.

Clay Halliwell offers a tip on utilizing 9600 bps through the 850 Interface:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Through the use of an ICD MIO or a CSS Black Box, it is possible to utilize modems at speeds up to 14.4 Kbps (V.32bis) at full speed with no loss of data. The serial R: device handler for the Black Box supports hardware flow control natively. Optional for the Black Box, but essential for the MIO, is the HyperSpeed handler by Len Spencer.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 6.1) What is the Atari 850 Interface Module?

While the Atari's SIO and controller ports did not conform to established
industry standards, Atari produced the 850 Interface Module to address this
issue. The 850 connects to the SIO port on the Atari, and provides:

- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port

Many "industry standard" (of the time) printers, modems, and various other
devices can be used with the Atari computer in combination with an 850
Interface Module.

Early 850's are in an all metal (black) case, but most are in a plastic beige
case matching the 400/800 computers. Other features:
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

PINOUTS

850 R1: Serial port DB9P:
5 4 3 2 1 _____________________________
9 8 7 6 / DB25P
1. DTR - Data Terminal Ready (out) + 20
2. CRX - Signal (carrier) Detect (in) + 8
3. XMT - Transmitted Data (out) + 2
4. RCV - Received Data (in) + 3
5. GND - Signal Ground + 7
6. DSR - Data Set Ready (in) + 6
7. RTS - Request to Send (out) + 4
8. CTS - Clear to Send (in) + 5
No connection to shield + Frame - to the shield wire

850 R2: Serial port DB9P:
5 4 3 2 1
9 8 7 6
1. DTR
3. Send Data
4. Receive Data
5. Signal Ground
6. DSR

850 R3: Serial port DB9P:
5 4 3 2 1
9 8 7 6
1. DTR
3. Send Data
4. Receive
5. Signal Ground
7. RTS
8. -8 Volts

850 R4: Serial port DB9P:
5 4 3 2 1
9 8 7 6
1. Send Data +
3. Send Data -
7. Receive Data +
9. Receive Data - (20 mA)

850 P: Parallel port DB15P:
8 7 6 5 4 3 2 1 _____________________________
15 14 13 12 11 10 9 / 36 pin Centronics (male)
1. Data Strobe + 1
2. D0 + 2
3. D1 + 3
4. D2 + 4
5. D3 + 5
6. D4 + 6
7. D5 + 7
8. D6 + 8
9. Data Pull up (+5v) +
10. - +
11. Ground + 16
12. Fault + 32
13. Busy + 11
14. - +
15. D7 + 9
No connection to shield + Frame - to the shield wire

Because the 850 was relatively expensive, provided more capabilities than the average user was looking for, and was at times unavailable from Atari despite high demand, there were many 3rd-party interfaces designed to provide some compatible subset of the 850's features. Perhaps the most prominent example of such a product is the P:R: Connection from ICD.

---

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;) ).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball Controller
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks
CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet ( + AtariArtist cartridge)

CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad ( + software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man), 2
joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC book,Invitation to Programming
2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

---

Subject: 6.4) What "vaporware" computers/peripherals were never released?

Atari was a HUGE company, dominating Silicon Valley, and included a massive
research and development department which famously designed many, many
products that never saw the light of day. Here is a brief listing of many
Atari hardware model designations known to have existed internally to the
company, but which were never sold and are extremely rare (if they ever
existed at all). For definitive information on unreleased Atari products,
see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,include disk drive
controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE
1250XLD Earlier name for the 1450XLD

1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not
included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals: (note some are more vaporous than others)
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col
display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

------------------------------

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A INPUT = 115-120 V AC, 50/60Hz

Rana 1000: 9 VAC 3.4 AMPS
MPP1000C modem: 9 V DC 200 mA (1.8 W)

------------------------------

Subject: 6.6) What graphic tablets were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Touch Tablet by Atari (came with Atari Artist cart., Micro Illustrator compatible),
- Koala Pad by Koala Industries (came with Koala/Micro Illustrator cart.);
- Powerpad by Chalkboard Inc. (came without software!); the following carts were available separately for the Powerpad: Micro Illustrator, Leo's Lectric, Micro Maestro, The Programmers Kit, Logic Games, Bear Jam (as refered to Antic, September 1984);
- Animation Station by Suncom (came with Micro-Illustrator cart.);

------------------------------

Subject: 6.7) What lightpens were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Lightpen (came with Atari Graphics cart.; it produces pictures with 127 sectors in length, thus not Micro-Painter, nor Micro-Illustrator compatible; however appropriate converter programs can be found in the public domain, e.g. the Rapid Graphics Converter);
- Edumate Lightpen (came with a disk with 6 Basic programs; a program called Peripheral Vision was available separately from Future House);
- Tech-Sketch-Lightpen (came in two versions: a) the cheaper version which included a disk with Basic programs only and b) the more expensive version which included the disk with Basic programs and the Micro-Illustrator cartridge);
- MC-Pen-Lightpen (came with a disk with 4 Basic programs);
- Reston Lightpen (came with ???);

Note: these infos were taken from Antic, September 1984; I am not sure, if all these items were really available as listed...

------------------------------

Subject: 6.8) What lightguns were produced for the Atari?

This section by Andreas Magenheimer.

- Atari LG-1 Lightgun (came in two versions: a) complete with XEGS, keyboard, joystick, power supply, tv-cable, Lightgun, FS II cart and Bug Hunt cart all in one package and b) in a separate package, containing the Lightgun and the Bug Hunt cartridge); thats's why Bug Hunt does not have its own package, it was always included with the Lightgun package and/or the complete XEGS package...
- BEST Lightgun by Best Electronics (a sort of selfmade (?) Lightgun);

- Sega-Lightgun (normally not Atari compatible; but can be converted
into an Atari compatible lightgun easily);
- other lightguns (most of these have to be converted)...

Note: After having 3-4 Atari and at least one (converted) Sega lightgun,
it is my personal impression, that the Atari lightgun merely works ok
on/with TV-sets (and not at all with a monitor), whereas the Sega lightgun
works alright on TV's and (most) monitors. Since I never had a Best
lightgun I cannot comment on this one... (Andreas Magenheimer);

---

Subject: 6.9) What paddles were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Paddles (usually a pair of Paddles);
- Telegames Paddles (available as a) a single paddle and b) a pair
of paddles);
- Reston Paddles (available as a) a single paddle and b) a pair
of paddles);
- and many others...

Note: Both single and duo (pair) paddles are compatible to each other,
using only one port-connector (only one joystick port). Thus, with a pair
of paddles you can connect up to 4 paddles (2 pairs) to the XL/XE models
and up to 8 paddles (4 pairs) to the Atari 400/800 models.

---

Subject: 6.10) What voice/sound synthesis hardware was produced for the Atari?

This section by Andreas Magenheimer.

- Voice-Box II by The Alien Group (a software and hardware package);
- 1400XL/1450XLD Voice Synthesizer (built-in chip inside the extreme rare
Atari 1400XL/1450XLD models);
- Talk is Cheap by Ed Stewart, Antic Volume 2 Number 4, July 1983,
pages 64-66; hardware schematics only (a test/demo program is
mentioned in the text, but not printed in the magazine!);
- Cheap-Talk by Lee Brilliant, Analog Computing, issue 29, April 1985,
pages 59-67; hardware schematics and software demos, for example
"First Words");
- many other voice synthesizers (mostly selfmade and based on a chip by
National Semi Conductor);

---

Subject: 6.11) What sound-digitizers/samplers were produced for the Atari?

This section by Andreas Magenheimer.

- Parrot (2-Bit) by Alpha Systems, Anthony Ramos;
- Parrot-2 (2-Bit or 4-Bit?) by Alpha Systems, Anthony Ramos;
- 2-Bit Replay (2-Bit) by 2Bit-Systems Ltd.

- Sound N'Sampler (2-Bit) by Ralf David;
- Sound Digitiser (2-Bit) by Ralf David;
- Sound-Meister (2-Bit) by Irata;
- Sound-Digitizer (2-Bit) by Irata;
- Digitales Mikrofon (2-Bit) by Compyshop;
- Voice-Master (2-Bit) by Covox Inc.;
- Analog-Sample-Processor (2-Bit) by Steven Lashower (Analog Magazine);
- Atari-Sound-Sampler (2-Bit) by Andreas Binner and Harald Schoenfeld (german Atari magazin 1/1989, pages 44-49, complete with schematics, documentation, sample-program and assembler-source);
- Alphasys-Sound-Sampler cart. (4-Bit) by ANG/Mirage (released as a mono version; a stereo (two Pokeys!) version was promised/planned, but afaik never released);
- ARGS-XE-Sampler (8-Bit) by ABBUC regional group ARGS (only one or two prototypes exist, alas the hardware was never released due to lack of (sampling/digitizing) software; maybe a good idea for the hardware and software experts out there!);
- and many others ...

---

Subject: 6.12) What sound-enhancement upgrades were produced for the Atari?

This section by Andreas Magenheimer.

a) enhancements for stereo-sound:

- POPS, polyphonic-pokey-sound by Lee Brilliant (stereo-support with one Pokey!); refer to Analog Computing, issue 66, november 1988, pages 54-60; only 1-2 programs exist for this mod., see: 8.14 stereo-software for the Atari;

- stereo with two Ataris (and thus 2 Pokey chips); use computer/pokey 1 for the left channel and computer/pokey 2 for the right; no special hardware required for this trick (but specially programmed software!); see also: 8.14 stereo-software for the Atari;

- stereo with 2 Pokey chips (in one Atari!); refer to an article written by Chuck Steinman (which probably appeared in Atari classic?) on how to upgrade your Atari internally with a second Pokey chip; or ask Freddy Offenga for a deluxe-stereo-version, that uses a PCB instead of the piggy-back method. For a list of software that supports this mod. see also: 8.14 stereo-software for the Atari;

- Stereo-Blaster and Stereo-Phaser by Portronic/AMC-Verlag, these were hardware add-ons that connected via the monitor jack to the Atari and gave you "another" monitor jack and 2 cinch connectors to connect to the monitor and/or the hifi-system; various small paddles (4-10, depending on the model you have) make it possible to change amplitudes, frequencies, etc. and thus generate a "pseudo-stereo" sound. These add-ons also amplified the sound and thus made quality recordings of Atari sounds much easier. Alas, these hardware add-ons were quite expensive and thus not many (less than 100) were sold. Therefore no

special software is required, every A8 sound can be changed or enhanced to "simulated-stereo"...

- Stereo-Blaster-Pro, a hardware add-on by Portronic/AMC-Verlag similar to Stereo-Blaster and Stereo-Phaser, but programmable! This add-on had only 1 small paddle, to amplify the sound-volume; the stereo-sound could be generated via two simple Poke-Statements, a demo-disk therefore was included. Alas, not many items were sold and afaik no-one else programmed stereo-software for it. See also: 8.14 stereo-software for the Atari...

b) other sound enhancements:

- Covox-Sound-Enhancement, originally developed in Poland; with some electronic parts and pieces you can upgrade your Pokey's abilities, to playback any digitised/sampled sound with 8-Bit resolution, instead of its usual 4-Bit digi/sample playback resolution (see also 8.14).

- SID-upgrade, the SID is the standard sound-chip in the C64 computers. Some polish freaks/nerds have found a way to include it into an A8, but allthough I have seen quite a lot of pictures (for example at atariarea.nostalgia.pl) with this mod. and already found 1 or 2 programs that detect it (for example System Info 2.x by Draco), I have not yet found any schematics for this upgrade. Anyway, it exists, and with some programming skills it would surely be possible to write programs then, that playback SID sounds on those Ataris which have this upgrade installed...

- Amie/Amy sound-chip, the Amie sound-chip was originally produced by Atari and installed into the 65XEM computer. Alas, it was never available to the public and only very few prototypes of this 65XEM (maybe less than 10?) do exist. Besides of that RUMOURS say, that Atari had quite some problems with this soundchip and never finished it completely/successfully. If the rumours are true, then this soundchip provided many more sound channels, more octaves and even more and better sound power than two Pokeys together (for more infos take a look at this URL: )

- guess there are dozens of other sound enhancements, for example sound cards (like Adlib, etc.), sound-chips, midi-interfaces, etc. that could be attached or converted to the A8; I won't name them all here...(A.M.)

---

Subject: 6.13) What MIDI enhancements are there for the Atari?

This section by Andreas Magenheimer and Mathy van Nisselroy.

Midi is standard on the Atari ST computers, because it is built-in into these computers. Nevertheless, Midi was long before the arrival of the ST computers on the market and thus, it is no surprise that there are even midi-interfaces and enhancements for the classic 8Bit Ataris. The following "types" do exist:

- "Midi-Mate" and "Midi-Track" by Hybrid Arts (USA), comes with hardware + software, see reviews & tests in Antic, Analog and other magazines. MidiTrack requires 48k RAM, MidiTrack II 64k RAM and MidiTrack III 128k RAM (XE compatible, not Axlon compatible). MidiMate features MIDI IN+OUT and SYNC IN+OUT ports, but lacks a second SIO plug. MMS (MIDI Music System) is a MIDI version of AMS, also sold by Hybrid Arts and comes with AMS to MMS converter software...

- "MIDI Master" by 2-Bit Software (UK), comes with hardware+software. Features MIDI IN+OUT ports, an extra SIO plug, but no SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDI interface" by DIGICOMM (UK), comes with hardware + 'example programs'. Features MIDI IN, THRU and OUT ports. There`s no word about a second SIO plug or any SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDIMAX" by Wizztronics (UK), comes with hardware and software. Features MIDI IN+OUT ports and a second SIO plug. The MMS software that comes with MidiMax requires 48k RAM and is fully compatible to the Hybrid Arts hardware+software. This means, one can use the software with both Midi-interfaces or use the interfaces with the software of both vendors...

- "Atari-Midi-Interface" by Karlheinz Metscher (appeared in the german magazine Computer Kontakt June/July 1986, pages 69-75, complete with documentation, schematics and its first program "Midi-Receiver"; in Computer Kontakt October/November 1986 appeared the second program, called "Midi-Disk" - a Midi Recorder and Player program);

- "Midi-Interface for Atari XL/XE" by Ireneusz Kuczek (appeared in the german ABBUC magazine, issue 65, pages 3-6); the paper-mag. includes a schematic for the midi-interface and some translated descriptions for the software (translated from polish to german language), whereas the disk-magazine contains the midi-programs "Midiplay Version 1.3" by I. Kuczek, "Midi-Recorder Version 1.2" by I.Kuczek, "Rec to Mid" by I. Kuczek (a converter program for the IBM-PC!), "Midi-Sequencer V.1.15" by Maciej Sygit and "Midi-Pattern-Editor MPE V.2.3" by Radek Sterba. These programs and many additional demo sounds are also available in the ABBUC PD library (PD numbers 625-632).

- guess there are several other (selfmade) midi-interfaces for the Atari 8Bit available, alas they also require a keyboard or synthesizer and self-created (or downloaded) midi-sounds can only be played back via such a midi-interface and the affore mentioned keyboard/synthesizer. As of yet, it seems there exists no midi-player program, that can playback any midi-sound via the Atari Pokey chip, nor any converter program, which can convert *.MID sounds into other Atari sound formats (that could be played back on the Atari then)...

---

Subject: 6.14) What graphics enhancements are there for the Atari?

This section by Andreas Magenheimer.

- some 80 column interfaces made by Atari and third parties. Allthough
these interfaces are there to provide a better text display with 80
chars. per line, they can somehow be used as a simple graphic
enhancement; think I have seen a graphic demo for the XEP-80 device
somewhere, that used a higher graphic resolution in Gr. 0 or Gr. 8
and also provided some animation (not only text, but also graphics),
alas I don`t remember the name of that demo...;
- the ultra-rare 1090XL box and probably graphic cards for it (who-ever
owns this item, doesn't use it, who-ever would like to have + use it,
doesn't own it or cannot afford it!);
- more seriously: Antic and GTIA upgrade by Chuck Steinman. Afaik, an
article about that topic appeared in Atari Classic, since I do not own
it, I can merely speculate that it adds a second Antic and GTIA for
higher resolution and/or more colours...;
- many selfmade upgrades, using graphic chips or graphic cards from other
computers...

---

Subject: 6.15) What types of memory upgrades are there for the Atari?

This section by Andreas Magenheimer.

Just a short overview here, for a more detailed description (table), see
also 8.10 kinds of atari ramdisks (and 8.11 + 8.12 for programs that
support or require a ramdisk). The following memory enhancements do exist:
- Atari 400/800: ramdisks on memory boards, that fit into the normal
Atari 800 memory slots (Axlon and Mosaic types);
- Atari XL/XE: a) internal memory enhancements:
- piggy-back versions,
- professionel PCB versions,
- SIMM-module versions;
b) external memory enhancements:
- via XL-Parallel-Bus,
- via XE-Cart.port+ECI,
- Flash-ROM cart. versions,
- other Cartridge versions,
- RAM-Card versions,
- SIO-cartridge versions,
- ...
Note that many of these XL/XE memory enhancements are just hobbyist or
selfmade-projects. Most versions which use newer PC technologies
(Flash-ROM cart., RAM-Card, SIO-cart., etc.) are still under development!

---

Subject: 6.16) What networking hardware is there for the Atari?

This section by Andreas Magenheimer.

In the late 80`s and early 90`s an american "firm" called Dataque
developed some networking-computer-hardware to link two or more Ataris

together, so that multiplayer games are possible, where each user has its own computer and tv/monitor screen. The hardware was/is computer independant and will run fine on any Atari 8Bit computer (whereas most software for it will only work on XL/XE computers). During a 3-4 year period of development two different hardware add-ons were developed:

a) Gamelink-1: This hardware was developed in 1989/90. It links two computers together via the joystick ports. It is limited to a maximum of 2 computers and thus 2 or 6 players, meaning one free port per XL/XE computer and 3 free ports per 400/800 computer. However, the few existing games for this hardware merely support 2 players, no matter, which computer you have...

b) Gamelink-2: This hardware was developed in 1991/92. It links 2 to 8 computers together via the SIO-port. One computer will then act as the master and has to boot up the software (from tape, disk, harddisk, etc.) first. Then all other "slave" computers connect to it and boot off of this master computer (one after another of course). In Europe we call this device "Multilink", mostly because of the games written by Bewesoft (Jiri Bernasek) called Multi-Dash, Multi-Race, Multi-Worms. A two-computer link-network can easily be done with one SIO cable, just open the end of the SIO cable and exchange cables number 3 and 5. You now have an easy two-computer (2-4 players) network-cable.

For some available software, that supports this networking-computer hardware, see 8.16 which programs support networking computer hardware...

---

Subject: 6.17) Can I attach an ISA card to the Atari?

Yes, RoBu (Roland Buhler) of the Stuttgart ABBUC Regional Group has produced project plans for an ISA-Bus Interface for Atari 800XL/130XE Computer, ARGS.
http://www.stud.uni-karlsruhe.de/~un55/Hardware/ISA-Interface/ReadME.html

Carsten Strotmann has released sourcecode showing how to access a Hercules video card with the ISA-Bus Interface.
http://www.strotmann.de/twiki/bin/view/APG/PgmFardwDriverHerc

---

Subject: 7.1) What versions of the Atari Operating System (OS) are there?

Most of this section by permission from:
http://www.student.kun.nl/f.offenga/atari.htm or
http://members.chello.nl/taf.offenga/atari.htm

Atari 8-bit Operating Systems
~~~~~~~~~~~~~~~~~~~~~~~~~~~~

3 800XE 03/01/1985 0x29f133f7 C300717
4 XEGS 05/07/1987 0x1eaf4002 C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
james adds (3/8/01):
Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
~~~~~~~~~~~~~~~~~~~~~~~~~~

'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:

http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

------------------------------

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information
Interchange. Pronounced ask-ee, ASCII is a code for representing English
characters as numbers, with each letter assigned a number from 0 to 127. For
example, the ASCII code for uppercase M is 77. Most computers use ASCII codes
to represent text, which makes it possible to transfer data from one computer
to another.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

The 8-bit Atari computers use a modified version of the ASCII character set called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 7.3) What is Atari BASIC?

BASIC is an acronym for Beginner's All-purpose Symbolic Instruction Code. Developed by John Kemeney and Thomas Kurtz in the mid 1960s at Dartmouth College, BASIC is one of the earliest and simplest high-level programming languages, incorporating components of FORTRAN and ALGOL.

In 1978 Atari contracted with Shepardson Microsystems, Inc (SMI) to create a version of BASIC for their upcoming home computers. The following worked together on the project, which resulted in Atari BASIC:

Paul Laughton (author of Apple DOS) - project leader, co-primary contributor
Kathleen O'Brien - co-primary contributor
Bill Wilkinson - floating point scheme design
Paul Krasno - implemented the math library routines following guidelines supplied by Fred Ruckdeschel (author of the acclaimed text, BASIC Scientific Subroutines)
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables Paul invented
Mike Peters - keypuncher/computer operator/junior programmer/troubleshooter

Three Revisions of Atari BASIC were produced: A, B, and C:
A - cartridge produced for use with the 400/800/1200XL
B - built-in to the 600XL/800XL, also produced on cartridge
C - built-in to the 800XL(late models)/65XE/130XE/800XE/XE Game System, also produced on cartridge.

In order to find out what version you are running, at the READY prompt,
enter "? PEEK(43234)"

If the result is: You have Revision: Atari Part#:
162 A CO12402/CO14502
96 B CO60302A
234 C CO24947A

On versions A, B, and C, Greg Miller writes:
"Rev A had a number of bugs, not just the commonly described crash bug.
Rev B fixed most (maybe all, I don't remember) of these, but in the
process, they added a new bug. You see, the crashes were caused by a bug
in one of OSS's memory move routines. When the bug was fixed, the fix
mistakenly applied to a routine that actually worked in Rev A, causing the
new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

Also concerning versions A, B and C, Russ Gilbert writes (3 Jul 2002):
"I've got an opinion on this, my opinion is wrong to 95% of Atari users.

B is a re-compile of A. C is a 12 byte patch to B.

I've used Atari BASIC for a millenium (?). B has less hangs and
ridiculous stuff like losing DIMs and stuff. C hangs like a lot. I must
admit I don't have very much experience with C as I go back to B after
using C for a short time.

I prefer B. I know its foibles. Just LIST, NEW, ENTER, SAVE every 5 or
6 SAVEs. Also, 0 REM will help with ENTERs that aren't working (put a
immediate 0 REM line before you ENTER.)"

------------------------------

Subject: 7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS 1.
The DOS 1 disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk
drives, from 1981-1983. It consists of two files:
DOS.SYS is loaded into memory from disk on startup
DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when
DUP.SYS is loaded, so that the data can be restored to memory when exiting

from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S. The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive. Supports double-density disk drives; also supports single-density disk drives. The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS 3 shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS 3 uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS 3, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS 3 was not widely accepted by the Atari community, and like DOS 1 is not generally used except for curiosity's sake.
The DOS 3 disk is labeled: Master Diskette 3 (DX5052).

DOS II Version 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS 3 disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS 3, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS 3, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS 1 and DOS 3 before it. Before its release, DOS XE was widely known as "ADOS."

---

Subject: 7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?

Section includes contributions by Andreas Magenheimer (most DOS 2 clone descriptions).

Atari DOS versions are very popular, but many 3rd-party DOS versions have also been developed over the years. Of these, MyDOS and SpartaDOS seem to be the most-used today.

MyDOS 4.53
==========
MyDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support, along with many other "high-end" features.

MyDOS 4.53/3 was released as freeware by David R. Eichel on 1/1/90. Defaults to a 3 character file length/free sector count instead of MyDOS's normal 4. Supports multiple AUTORUNs at boot up (*.AR0 through *.AR9). Supports Axlon RAMdisks.

MyDOS 4.53/4 is the same as 4.53/3, but uses a minimum of four characters in the sector count just like most versions of MyDOS.

MYDOS 4.51 was developed by Wordmark Systems (Charles Marslett). Source code is available as "abandonware" at: http://www.wordmark.org/

MYDOS 4.50 was released on 11/28/88, developed by C. Marslett & R. Puff
http://www.nleaudio.com/css/files/MYDOS45M.ARC

Mathy van Nisselroy's MyDOS page:
http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm

SpartaDOS 3.2, 3.3, X (4.22)
============================
SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MyDOS disks.

There are many versions available. Hopefully this list will help keep them all straight.

SpartaDOS X (SDX) cartridge
---------------------------
Greatly enhanced/expanded compared to disk- based SpartaDOS; completely different source code. Several versions produced:
4.22 11-05-95 released by Fine Tooned Engineering (FTe)
4.21 7-10-89 released by ICD
4.20 2-06-89 released by ICD
4.19 1-16-89 released by ICD
4.18 10-29-88 released by ICD
4.17 ?-?-88 released by ICD

SpartaDOS Pro 3.3a, 3.3b, and 3.3c - 1994-
----------------------------------
The SpartaDOS Pro 3.3 versions were developed by Stephen J. Carden, based upon a dissembled copy of the older (more stable?) 3.2c release from ICD.
-- SpartaDOS Pro Ver 3.3a 3-Nov-94 -- Added MUX support and MS-DOS Commands. Highspeed SIO routines NOT included. Recommended for use in emulators (especially Xformer) only.

-- SpartaDOS Pro Ver 3.3b 25-Dec-95 -- Has two different SIOV handlers, one for the MUX and one for the MIO.
-- SpartaDOS Pro Ver 3.3c 1995 -- Looks at your system and by checking it determines what CIO handler to load, and has MS-DOS command set. Black Box, MUX, and MIO are fully supported, though none of these are required.
-- SpartaDOS Pro Ver 3.3c 19-Dec-97 -- the same 3.3c produced on a 16K ROM cartridge by Video 61.
-- SpartaDOS Pro Ver 3.3d -- exists, but is not in general release

According to Lance Ringquist:
K-Products contracted FTe to develop SpartaDOS Pro 3.3 for exclusive use and distribution with K-Products' BBS Express! Pro, to provide this BBS system with the most stable platform possible. As Video 61 now owns the rights to BBS Express! Pro, SpartaDOS Pro 3.3 is therefore now a product of Video 61.

According to Stephen Carden:
The SpartaDOS Pro 3.3 versions were never owned by K-Products, and are technically shareware owned by FTe, although FTe had no connection with the specific development of the 3.3 versions.

SpartaDOS 3.2g and 3.2gx - Dated 6/4/94.
---
Last official disk-based versions, released as shareware by Fine Tooned Engineering (FTe), who had purchased the rights from ICD. 3.2g is the primary version; 3.2gx differs only in that it locates the disk buffers under the OS to save RAM. 3.2gx is intended for use in systems that include a PBI device (MIO, Black Box); it is not compatible with BASIC XE or any other programs using RAM under the OS.

First shareware release from FTe: 3.2f.

Earlier major releases from the original developer, ICD: 3.2d, 3.2c, 2.3, 1.1.

Only the SDX cartridges and the original version 1.1 are compatible with the 400/800 computer models; SpartaDOS 2.x, and 3.x require an XL/XE.

Many disk-based SpartaDOS versions are available for download here, Thunderdome, kept by SysOp Fox-1:
http://www7.brinkster.com/atari/ataridl/sdsys.htm

One source of SpartaDOS documentation is Russ Gilbert's page at:
http://my.en.com/~russg/

BW-DOS 1.30 and BW-DOS Update #2 - Released: 12/95 ("BeWe")
==========
Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek. (it is pronounced "Bay Vay Dos") which is SpartaDOS compatible. Does not use any speeder internally, but comes with external XF551 speeder. Supports 4 drives and Ramdisk, comes with Ramdisk driver for XE compatible Ramdisks up to 1Megabyte; supports 4 densities: a) Single (90k), b) Enhanced/Medium (130k), c) Double (180k) and d) DSDD (360k); does not use any RAM under OS ROM; unlike SpartaDOS most commands are external, thus the DOS is only 5kbytes short; supports a PAL clock (made by ABBUC regional group "ARGS"); comes with many

great utilities (which can also be used with SpartaDOS); paper printed German and disk printed English docs are avaiable; latest version 1.3 is avaiable as Freeware...

The other DOS varieties mentioned below are all, like MyDOS, Atari DOS-2 clones and thus DOS-2 compatible; avaiable as PD or Freeware...

TOP-DOS 1.5+
============
Carolyn Hoglin writes:
This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

SuperDOS 5.1
============
supports 4 formats SD/ED/DD/DSDD; supports 256k Xtra RAM/RD; supports 4 speeders: Happy+Speedy+XF551+US Doubler and its compatibles; has an AUX.SYS file with option to use / not use RAM under OS ROM; has unfortunately a very slow Ramdisk;

BiboDOS 5.4 and 6.4
===================
3 versions avaiable, one without speeder - 5.4NT, one with Happy/Speedy support 5.4HS and one with XF support 6.4XF; supports 4 formats / up to 360k; supports 256k Xtra Ram / RD; the DUP.SYS uses RAM under OS ROM, thus Turbo-BASIC must load without DUP;

Turbo-DOS 2.1
=============
Master-Disk produces 4 different versions: 2.1NT without speeders, 2.1HS for Happy/Speedy, 2.1XF for XF551 and 2.1EX for 3 speeders: Happy+Speedy+XF551; supports 256k Xtra RAM / RD and supports use of batchfiles; has converter for DOS 3 and DOS 4; supports 4 formats, up to 360k; does not use RAM under OS ROM; DUP uses a Command Processor; all commands are avaiable via HELP key; works with XL/XE computers only, does not load/boot on Atari 400/800 no clue why;

---

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)

and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

---

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer, Mathy van Nisselroy, Kathleen Ferrante

- Diamond GOS version 1 (a cart and a PD demo-disk-version do exist), version 2 (cart only), version 3 (cart only); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-BASIC; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-BASIC;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-BASIC; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the BASIC file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small BASIC program, that looks like a GUI; it can merely load BASIC files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- BASIC desktop, a GUI written in BASIC just as a sample, what can be done with an 8-bit computer; this one loads BASIC and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and BASIC files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/
1) Lets you use any demo or intro as a screen saver!!
2) Works with all Atari hardware, BB, MIO and Hard drives, SpartaDOS support
3) Lets you run files like full games and demos and then
return back to the desktop. It uses Overlays.

- Atari Desktop by ABC software (Poland), includes editors, converters, file copiers, sector copy, tape+turbo tape copy, small games, CMC finder and player and much much more; works with 64k RAM and keyboard input; disk manuals only in polish language...

- Windows XL a Turbo-BASIC GUI with some nice add-ons, like calculator, editor and other things. written in 1986-1988 by Joerg Forg.

- there are a lot more GUI programs, however many of them are written in BASIC or Turbo BASIC and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

---

Subject: 7.8) What should I know about modem device handlers?

In order to use a modem on the Atari, a modem software handler, or R: device handler, must be loaded into memory.

There are several families of R: handlers, corresponding to the different ways in which a modem may be attached to the Atari.

Except for family #7 below, these handlers are used in one of two ways. Either they are (A) loaded into memory from DOS just before running the main terminal application, or (B) the terminal program is appended to the handler, so that in practice, a single file is loaded from DOS which contains both the R: device handler and the application itself.

1) 835/1030/XM301 modems. Atari-only modems, interface via SIO

2) MPP/Supra modems. Atari-only modems, interface via joystick port

3) R-Verter cable. Connect standard Hayes-type modems via SIO
/ SX212 modem. A Hayes-compatible modem, interface via SIO

4) SWP ATR8000 interface. Standard Hayes-type RS232 modems via this interface.

Richard Anderson writes (Oct 2 02):
Mine originally came with a driver program; and, I believe, a BASIC program to set up the driver from BASIC. Later they shipped with a special version of MyDOS with the R: handler built in.

5) 850 Interface/P:R: Connection, internal

This type of "mini handler" simply loads the R: device handler code from a ROM chip inside the RS232 serial interface. A long beep is heard through the speaker when the handler is loaded into the computer's RAM.

Many varieties of DOS for the Atari include an explicit provision for loading this type of R: handler into memory from the 850 or compatible interface.

Also, this type of R: handler is automatically loaded when any 8-bit Atari computer is turned on with a P:R: Connection or powered 850 connected, but no powered disk drive is present.

6) 850 Interface/P:R: Connection, external

Used with the 850/P:R: Connection in place of these interfaces' built-in handlers.

7) MIO/Black Box interfaces, internal

These interfaces utilitize the PBI or ECI parallel ports on the Atari. They include their own R: handlers in ROM, using no computer RAM at all.

8) MIO/Black Box interfaces, external: Len Spencer's Hyperspeed

This handler is "optional" for the Black Box, but "essential" for the MIO in order to take full advantage of the high-speed hardware handshaking capabilities of these two interfaces.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 8.1) What programming languages are available for the Atari?

QS FORTH info from Winston Smith, 3/03

Much work on the FORTH section by MCurrent 4/03, based primarily on:
http://www.strotmann.de/twiki/bin/view/APG/LangForth from Carsten Strotmann

This section is by Freddy Offenga.

What programming languages are available for the Atari?

Revision : 1.8
Date.... : 2002-10-13

==========
The goal is to give information about all available languages
for the Atari 8-bit computer. This information includes:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Author: Freddy Offenga
Email : taf.offenga [at] chello.nl (replace " [at] " with "@")

==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Credits
=======
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup
- umich (University of Michigan Atari archive)
- David Wyn Davies (PL65)
- Kevin Savetz (APX titles)
- Maury Markowitz
- Michael Current
- JT (ValForth)
- Andreas Magenheimer

Revision history
================

1.8
Thanks to Adreas Magenheimer for these updates:
- Added "Mesa-Forth"
- Added "130XE Assembler 4.32"
- Updated "SynAssembler"

1.7
Thanks to Maury Markowitz for these updates:
- Updated "A BASIC Compiler"
- Added "Der BASIC Compiler", "MMG BASIC Compiler"

- Added "Frost BASIC", "TT-BASIC XL"

1.6
Synchronized with Atari 8-bit FAQ May-2002 :
- Added "X-Assembler"
- Added "CTH Fast Basic"
- Added availability for "Deep Blue C"
- Added availability for "Atari Pascal"
- Ignored changes "Kyan Pascal" (need more info)
- Updated "ValForth"
- Updated "Extended fig-Forth"
- Updated "fun-Forth"
- Added "Extended WSFN"
- Removed e-mail addresses
- Added availability for "A65"
- Updated "PL65"

1.0 .. 1.5
Changes not noted.
Old versions are available on request.

a) ASSEMBLER

- 130XE Makro Assembler (disk)
version, year : 4.32, ?
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #297
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell for 128KB RAM Ataris. Source format
is derived from Atmas Makroassembler.

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #368
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
New version with 128KB - 1088KB RAM support.
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : abandonware, http://www.wordmark.org/
package..... : assembler, manual
features..... : source include

Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk) (CX8121)
version, year : 1.0C, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- ATasm (disk)
version, year : 0.92, 1999
author/company : Mark Schmelzenbach
available..... : umich
package..... : assembler
features..... : macros, source include, optionally target .XFD
disk images and machine state files (Atari800 / Atari800Win),
conditional assembly. Two pass 6502 portable cross assembler.
Highly compatible with MAC/65.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/

monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package....... : assembler, editor, menu, manual
features...... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package....... : assembler, editor, monitor
features...... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package....... : assembler, editor, disassembler
features...... : ?

- Kasm65 (disk)
version, year : 2.51, 1997
author/company : Ken Siders
available..... : shareware, umich
package....... : assembler, editor, linker, docs
features...... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package....... : assembler, menu, editor, monitor, docs
features...... : macros, source include, data include,

conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package....... : assembler, linker, librarian
features...... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : -
package....... : assembler
features...... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package....... : assembler, editor, menu, debugger
features...... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package....... : assembler, linker, librarian
part of cc65 (c-compiler)
features...... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : http://www.atariland.com/members/oldatarian/
package....... : assembler, editor, monitor, manual
features...... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : -

package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

- X-Assembler
version, year : 2.4, 2001
author/company : Piotr Fusik
available..... : freeware
package..... : assembler, docs
features..... : conditional assembly, source include,
binary include, pseudo commands,
pseudo addressing modes
Two pass 6502 cross assembler for PC. The source
format is backward compatible with Quick Assembler.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.05, 1987
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari

available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- CTH Fast Basic (disk)
version/year : ?
author/company : Tom Hunt/Closer to Home
avaiable.......: PD, Freeware or Shareware;
package........: language plus several test files
and examples; english docs;
features.......: faster than Atari Basic, not much
slower than TB, does not use Ram under OS;
avaiable at Tom Hunt's homepage or elsewhere...

- Der BASIC Compiler (?)
version, year : ?, 1983
author/company : Datasoft
available..... : ?
package....... : BASIC compiler
features...... : ?

- Frost BASIC (?)
version, year : 1.04, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Version of Turbo Basic XL that runs on 48k machines (400/800).

- MMG BASIC Compiler 2.0 (?)
version, year : 2.0, 1984

author/company : Special Software Systems
available..... : ?
package....... : BASIC compiler
features...... : ?
It appears that this is a newer version of Der BASIC Compiler,
licensed to some other company.

- TT-BASIC XL (disk)
version, year : 2.11, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Published in the German magazine "Happy Computer".
Appears to be a newer version of Turbo Basic XL.

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler (V1.1)
features...... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package....... : ?
features...... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package....... : ?
features...... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : umich archive,
http://www.umich.edu/~archive/atari/8bit/Languages/Cc65/
package..... : compiler, linker, assembler, librarian
features..... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package..... : Compiler
features..... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : http://www.atariarchives.org/APX/showinfo.php?cat=20166
Source code "Deep Blue Secrets" downloadable at
http://www.atariarchives.org/APX/showinfo.php?cat=20179
package..... : Compiler, Linker
features..... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package..... : Editor, Compiler, Optimizer, Linker
features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
Information at http://www.atariarchives.org/APX/showinfo.php?cat=20102
package....... : ?
features...... : ?
Needs two drives.

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package....... : ?
features...... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package....... : editor, compiler, linker, macro-assembler
and manual
features...... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package....... : ?
features...... : ?

f) FORTH

- ES-FORTH
version, year : 1.2, 1984

author/company : The English Software Company
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthESForth
package..... : ?
features..... : says Carsten Strotmann: "Seems to be based an fig-
FORTH,
but with some unique "Words". Works with normal DOS.

- Extended fig-FORTH, (disk)
version, year : 11/10/1981
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- Extended fig-FORTH, (disk)
version, year : 1.1 Rev. 2.0, 01/15/82
author/company : Patrick L. Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
http://www.strotmann.de/twiki/bin/view/APG/LangForthFigOneOne
package..... : ?
features..... : ?

- fig-FORTH (disk)
version, year : 1.0D
author/company : ?
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthFigOneZeroD
package..... : ?
features..... : ?

- fig-FORTH
version, year : 1/26/81 and 4/01/82 releases
author/company : Steven R. Calfee "Team FORTH"
available..... : ?
package..... : ?
features..... :
http://www.atariarchives.org/APX/showinfo.php?cat=unknown_fig

- fig-FORTH
version, year : 4/10/82
author/company : Peter Lipson / Robin Ziegler "Team FORTH"
available..... : ?
package..... : ?
features..... : based on 4/1/82 release of fig-FORTH by Steve Calfee

- fig-FORTH
version, year : 5/5/82 - 10/16/82
author/company : Harald Striepe "Team FORTH"
available..... : ?

package..... : ?
features..... : based on 4/10/82 release of fig-FORTH by Lipson/Ziegler

- fig-FORTH, Antic (disk)
version, year : 1.4S REV.H, 18Jun85
author/company : John Stanley/Antic Magazine "Team FORTH"
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthAntic
package..... : ?
features..... : based on 10/16/82 release of fig-FORTH by Striepe

- fun-FORTH (disk)
version, year : ?
author/company : Joel Gluck, APX
available..... : APX-20146
http://www.atariarchives.org/APX/showinfo.php?cat=20146
package..... : ?
features..... : ?

- Grafik-FORTH
version, year : 1990
author/company : RAI Production
available..... :

http://www.strotmann.de/twiki/bin/view/APG/LangForthGraphicForth
package..... : ?
features..... : based on fig-FORTH 1.4S and TURBO-GRAPHICS-SYSTEM 256

- MesaForth
version, year : 12/03/81
author/company : ?
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthMesa
package..... : language, source code, documents, examples
features..... : based on 6502 fig-Forth. The major difference is in
the size of the screen on disk (512 bytes instead of
1024 bytes). Runs under ATARI DOS 2.0S.

- QS FORTH
version, year : 1.0, 3/27/81
author/company : James Abanese / [QS] Quality Software
available..... : http://www.strotmann.de/twiki/bin/view/APG/LangForthQS
package..... : Editor, Assembler, I/O routines
Single Density 5.25 Floppy and Manual in Binder
features..... : Editor, Assembler, I/O Routines. based on fig-FORTH.

- turbo-4th
version, year : January 1985
author/company : Steven R. Calfee
available..... : ?
package..... : ?
features..... : compatible with fig-FORTH and Team FORTH. It's fast.

Not threaded, it is a true compiler

- ValForth (disk)
version, year : 1.1, 1982
author/company : Valpar International
available..... : ?
package..... : (8) disks in the set including: 1)master disk,
2)display formatter, 3)text compression and auto text formatting,
4)valDOS-I, 5)valDOS-II, 6)player-missile graphics, character editor and
sound editor, 7)general utilities and video editor, 8) Turtle &
valGraphics and advanced floating point routines.
features..... : based on fig-FORTH

- X-FORTH
version, year : 26 Jan 2003
author/company : Carsten Strotmann
available..... : http://www.strotmann.de/twiki/bin/view/APG/ProjXForth
package..... : binary, source, disk image with samples & editor
features..... : aims to be compatible with new ANSI standard.
works with normal DOS.

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package..... : ?
features..... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package..... : ?
features..... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package..... : compiler, editor, monitor and library
features..... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Extended WSFN, WSFN = Which Stands For Nothing
version, year : ?
author/company : Harry Stewart, APX
available..... : APX-20026
package..... : ?
features..... : ?
Info at http://www.atariarchives.org/APX/showinfo.php?cat=20026

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- PL65 (disk)
version, year : 1.0, 1987
author/company : Noahsoft
available..... : commercial, Extremely rare.
package..... : compiler, editor, library, sample game
features..... : Similar features to Action with same restrictions.
Highly flexible language that includes inline assembler features and
pointers. Robust and well-engineered editor. Does not require
additional runtime library - automatically generated and included in
the compiled code during compilation.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

---

Subject: 8.2) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)
Real Time Cartridge Sunmark, http://www.sunmark.com/

---

Subject: 8.3) What games support 4 or more simultaneous players?

contributors to this section:
Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat Mulvey,
Steven E. Posey (Party Quiz), Andreas Magenheimer

a) The following games support 3 simultaneous players:
(2 players via joystick, 1 player via keyboard)

- Dynakillers by GMG/Slovakia (Freeware!)
- Blastermind by Numbercruncher/Germany (Freeware!)
- M.U.L.E. cracked+changed by CSS/Germany (pirate copy!)
- some more PD and commercial games...

b) The following games support 4-joystick head-to-head play:
(Only the 400 and 800 computer models sport 4 controller ports)

- Asteroids cart. by Atari,
- Basketball cart. by Atari,
- Dandy disk by APX,
- M.U.L.E. disk by ECA,
- Maze War disk or cart. by ???,
- Silicon Warrior disk or tape by Epyx,
- Survivor disk or cart. by Synapse,
- Major League Soccer cart. by Thorn EMI,
- Major League Hockey cart. by Thorn EMI,
- Volleyball by ???
(PD game written in Atari BASIC);
- Tank Battle by ??? from Antic magazine
- Roadblock by Brian Holness from Compute! magazine
- Battle Room (CIA vs. KGB) a PD game by SNACC
- Aliens a PD-game by ??? using an altered Dandy program
(the Dandy font and thus the graphics were changed, however,
the levels remain the same and can be used in both games);
- Sky Warrior by ??? from ROM magazine, June 1984 ***
- Depth Warrior by ??? from ROM magazine, Aug. 1984 ***
- Yellow-Brick-Road by ??? from ROM magazine, Feb. 1984 ***

*** these programs are reported to be 4-player programs, I'm
not sure if they are meant to be 4-players simultaneously
or 4-players - one after another (try to find out!);

c) The following games support 8 players on the 400/800 or 4 on the other
computer models, using the 2 controllers-per-port CX30 Paddle controllers:

- Super Breakout by Atari,
- Worms by Electronic Arts
(has nothing to do with the PC game!)

d) The following game supports 4 players on all machines, using special
4-button keypad controllers linked together with RJ-11 jacks (standard
phone jacks) to a box with 2 joystick port connectors:

- Party Quiz by Suncom

e) The following programs support multi-joystick games, using extra
hardware called Quadrotron (from the german Atari magazin 2/1989):

- test program for 4 joysticks (and assembler source);
- Quadro-Tron by H.Schoenfeld (4-player Tron-clone);

f) The following programs support multi-joystick games, using extra
hardware called Multijoy (multijoy4 for up to 4 players, multijoy8
for up to 8 players and multijoy16 for up to 16 players; originally
developed by Raster/Radek Sterba, but also available from ABBUC):

- Cervi by R.Sterba (up to 8-players Snake-clone);
- Multijoy by R.Sterba (up to 4 players Tetris-clone)
- Bremspunkt by T.Butschke (up to 4 players Car-race);
- Sheep by F.Dingler (up to 8 players Sheep-race);
- Cards by F.Dingler (up to 8 players grab-a-card-game);
- Ice-Hockey by F.Dingler (up to 8 players Icehockey-game);
- Quadrotron-M4 by R.Sterba (patched Quadro-Tron for Multijoy);
- Shoot Em' All by R.Sterba (16 players shooting-game)

---

Subject: 8.4) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatible with models other than the
original Atari 400/800. Most probably do work on XL/XE's if you use a
translator to run the original 400/800 OS on your XL/XE. (Alas, most
translator-versions are limited to disk access, thus booting/loading
a tape [and especially a cartridge] can be difficult sometimes...A.M.)

Apple Panic Broderbund
Aquatron Sierra On-Line
Astro Chase First Star Software / Parker
Atari Word Processor Atari
(this is not the same as AtariWriter!)
Atlantis (some versions!) Imagic
Attack at EP-CYG-4 (by Bram) Romox
Bandits Sirius Software
BearJam Chalkboard Inc.
Boulders And Bombs CBS
Chicken Synapse
Demon Attack Imagic
Disk 50
Dreadnaught Factor, The Activision
Drelbs Synapse
Forbidden Forest Cosmi
(later versions by different companies work ok on XL/XE!)
Fort Apocalypse Synapse
(cart version is 400/800 only! tape+disk versions work ok on XL/XE!)

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Andreas Magenheimer adds:
To get an overview or see a chart of OS changes from the 800 to the XL
line, refer to Antic magazine Volume 3, Number 2 (June 1984), pages 10-14;
Also note, that some software will not work correct (or not at all) on
newer XE/XEGS versions (which have a new OS with a new version number,
a new selfttest/memory-test/keyboard-test, larger RAM chips, etc. etc.);

---

Subject: 8.5) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

- Bug Hunt cart. by Atari;
- Barnyard Blaster cart. by Atari;
- Crossbow cart. by Atari;
- Crimebuster cart. by Atari;
- Operation Blood disk by ANG/Mirage;
- Operation Blood II - Special Forces disk by ANG/Mirage;
- Light Gun Blaster (PD from Page 6);
- enhanced Lightgun Blaster (PD from Pedrokko);
- Gangsterville disk by Linda Soft
(an italian game written in BASIC);
- maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4."
This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
All Lightgun games can be used with a lightpen (which is not as accurate
as a Lightgun however). And all lightpen programs can be used with a
lightgun. thus add:

- Atari Graphics cart. by Atari
(a painting/drawing program);
- Matrix a PD game by Dave Oblad
(a 4-wins or 5-wins clone!)
- Alien Invaders disk by R.Gore (available from DGS);
- Bembelwo a PD game by Thorsten Butschke
(a sort of golf/minesweeper game, written in Quick);
- Sharp Shooter by Mat*Rat a PD game from Analog,
(also available on cart from Video 61/Lance Ringquist);
- Lightgun Shooter by ??? from ABBUC mag.
(a simple shooter game, at least PD!)
- Flyshot or Flyshoot a PD game by Kemal Ezcan
(a Turbo BASIC game from ZONG, the KE Soft magazine);
- Geisterschloss game+editor disk by KE Soft;
- Lightpen Doodle by ??? from Antic magazine;
- some more PD programs and utilities for Lightpen or Lightgun;

---

Subject: 8.6) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title Keystroke Required
------------- --------------------
- Missile Command by Atari CTRL-T
- Slime by Synapse [T]
- Shanghai by Activision choose controller type: ST mouse !
(plug it into port 2; if you do not
have one, you have to reboot!!)
- Bombdown by Roemer of Uno choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
- Minesweeper by Raindorf-Soft use an ST mouse in port 2
- The Brundles by KE-Soft use an ST mouse in port 2
- The Brundles Editor by KE-Soft, PD use an ST mouse in port 2
- Geisterschloss by KE-Soft, PD choose Lightgun (port 1) or ST
mouse (port 2)
- Vanish (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Hong Kong (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Maus-DOS (ZONG 5+6/1993); use an ST-mouse in port 2
- Faecher-Patience (ZONG 1/1993); use an ST-mouse in port 2
- Macao (Zong 5+6/1994); use an ST-mouse in port 2
- Multi-Mouse manager (PD) drivers for mice, TB, etc.
- Multiplayer 2.1 by Madteam supports ST + Amiga mouse in port A
- Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
- Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
- little Calculator (AMC-Verlag, PD) uses ST-mouse only (port 2)
- big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to
use to *.EXE; all drivers use port
1 - if I remember correctly)
- Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
- Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
- Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
- M.O.S. (ABBUC magazine) uses an ST mouse in port 2
- Diamond GOS (Reeve software) all three versions support an ST
mouse in port 2
- S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
- G.O.E. (TCS) supports an ST mouse in port 1
- BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions available... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is

also a tape version (and maybe a disk version) of MC available. I am not sure if this tape version behaves like the old 800 version or like the newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball and ST-mouse. Although MC works with both input devices does not mean, they are the same. they are not !! Connect the TB to an ST computer and you see: it does not work at all !! You have to do a small conversion to convert the TB to an ST mouse. (Plans are avaiable from ABBUC, Germany).

---

Subject: 8.7) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- One on One (Compute!) a breakout/warlords clone
- Paratroop Attack by David Plotkin
- all Pinballs created with the P.C.S.
(use left paddle trigger for left flipper and right paddle trigger for right flipper; or simply use a joystick and left/right/fire button);
- many more Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

for Koala Pad only: - Micro-Illustrator / Koala Painter
- other Koala Pad painters or programs

---

Subject: 8.8) What programs have a CX85 Numerical Keypad mode?

Andreas Magenheimer contributes:

- Bombdown (Roemer of Uno);
- The Bookkeeper (Atari);
- Multi mouse Management (PD);
- UPN calculator (PD);
- Ball Harbour (Zong 8/1992);
- The Big Quest (Zong 7/1992);

- Blob (Zong 2/1992);
- Bomber Jack (KE-Soft);
- Catch (Zong 6/1992);
- Code table (Zong 11+12/1993);
- CX-85-Driver (Zong 7+8/1994);
- CX-85-Keycode-driver (Zong 7+8/1995);
- Donald (by KE-Soft);
- Drag (by KE-Soft);
- Dragon Fire (Zong 1/1993);
- Gravitar (Zong 4/1992);
- Hungry Goblin (Zong 5/1992);
- Invaders (Zong 5+6/1993);
- Joshi (Zong 3+4/1993);
- Lasermaze (by KE-Soft);
- Lost in the Antarctic (Zong 2/1992);
- Mampfman (Zong 8/1992);
- Minipac (Zong 3/1992);
- Minipac 2 (Zong 6/1992);
- Money Raider (Zong 2/1992);
- Monster Tracking (Zong 9/1992);
- Oblitroid (by KE-Soft)
- Pac-Man (Zong 11/1992);
- Schlumpf/Smurf (Zong 5/1992);
- Slurp (Zong 3/1992);
- Techno Ninja (by KE-Soft)
- Transsylvania (Zong 3+4/1993);
- Viro-Mania (Zong 2/1993);
- Zador XL (by KE-Soft)
- Zador II (by KE-Soft)
- many more games from KE-Soft and Powersoft;
(forgot their names, help needed!)

---

Subject 8.9) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- Musorqua (Analog computing) educational program
- many more (which I do not remember right now!)

---

Subject: 8.10) What kinds of RAMdisks can be set up on the Atari?

This section by Andreas Magenheimer.

8.10 Atari Ramdisks - An (incomplete) Overview:
[This is version 2.10 from October 2003]

Right from the start of the Atari 8-bit computer era in the late 70`s, Atari users wanted to have as much RAM as possible (or as their purse could afford). Having a 16k machine with a tape device was nice and cheap, but having full 48k or 64k and a floppy drive was much nicer (and very expensive). Thus many Atari users began to create selfmade RAM extensions and enhancements, just to save some money. Also a lot of firms provided extra RAM, RAM enhancements, RAM extensions and Ramdisks. Besides Atari there were (and still are) quite a lot of producers, manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or manuals, but gives some info about the various Ramdisks on the market. Since these notes are written by me, they will merely contain the information I have. And as you all can see - it is still incomplete. So any help and extra info, as well as corrections, are very welcome. It would be nice to see this text & info growing. For now let us start here, the info-section is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above information should be enough for most programmers to support a RD in their programs (especially to support more than just one type of RD). Hopefully future programs will take care about this info or just use a small setup program to setup any kind of RD. Now let me begin:

---

A) Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board

Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible;

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,
32k and 64k (where max. 52k can be utilized from 64k). Looks like
these are no Ramdisks, just (normal/main) RAM enhancements. But maybe
the 64k Ramboard can be patched in some way to gain a small 16k or
32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

---

B) Atari XL/XE Ramdisks:

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard convention
as the majority of ramdisk users don't want bit 4 counted as a control bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the 'on'
bit for ANTIC's access to the extended memory for 'compatible' (to 130XE)
machines as well. If bit 5 does show up in a bit use table, one can only
assume that this is an incompatible machine which doesn't have or use ANTIC
access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);

XE`s made in China have faulty GTIAs => replace them!;
XE`s and XEGS made in China also have a new OS which causes
some incompatibility problems (try: Encounter / disk version
by Novagen or try: Muad`Dib-Demo by Hurek, etc.); just replace
the new OS with an older XL/XE one if you want less trouble!;
standard Atari RD - available with all XE-compatible ramdisks;
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 192k-600XL Compyshop 128k
4000-7FFF 2,3,? B ($D301)
Banks: e3,e7,eb,ef,a3,a7,ab,af;
Notes: early CS upgrade version for 600XL only!;
afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-800XL Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-130XE Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version with sep. Antic!;
(XE meant 130XE only! this excluded 65XE and 800XE!);
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 512k XL various authors 448k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3,af,ab,a7,a3,8f,8b,87,83
6f,6b,67,63,4f,4b,47,43,2f,2b,27,23;
Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
The new version will replace the 64k main RAM with 512k RAM, thus
you gain 64k RAM and 448k Ramdisk. (A.M.: Afaik, it has the same
problems as the 256k RAM enhancements [with 64k RAM and 192k Ramdisk],
meaning *some* programs will try to use the main RAM as rambanks...)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: manual and schematics, as well as a parts list can be found
in german Atari Magazin 2/1987 (includes a Basic test program!);
bugfixes and updates in Atari Magazin 3/1987, 4/1988 and 5/1988;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- Bob Woolley`s Atari 1200XL 1MB upgrade 960k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: EF, ED, EB, E9, E7, E5, E3, E1
CF, CD, CB, C9, C7, C5, C3, C1

AF, AD, AB, A9, A7, A5, A3, A1
8F, 8D, 8B, 89, 87, 85, 83, 81
4F, 4D, 4B, 49, 47, 45, 43, 41
2F, 2D, 2B, 29, 27, 25, 23, 21
0F, 0D, 0B, 09, 07, 05, 03, 01
Notes: this upgrade uses 64k as main RAM and 960k as Ramdisk;
Selftest: Yes!, Basic: "no" (not built-in), Antic access: no! ;

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS: Missile Command=YES!;
no use of any switches!; Antic access: YES!; (CS-compatible!);

- Megaram 1 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: used 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 2 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 128kbyte Chips x2 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David;
newer MegaRAM version; fully compatible to Megaram 1;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 1,2 => 512k B.Pahl 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 03,07,0B,0F,23,27,2B,2F,43,47,4B,4F,63,67,6B,6F,
83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: upgrade for Megaram 1 or 2 to 512kbytes (which means
a total of 576kbytes memory); requires a small pcb (in
connection with the existing Megaram 1 or 2 pcb) and the
following chips: 2x 414256 (RAM), 1x 74LS138 plus some more
wires inside the computer; additionally one may install a
switch to switch down to 320k or even 64k (no RD!) if needed;
advantage: more RAM, Basic still there, 26AE & 8ACE banks...;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
K.P./R.D. Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
$D600: F3,F7,FB,FF...
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four switches; the 1MB mode seems to be very incompatible!!;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

=> Note that all XL-type Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one 74LS08 chip (see ABBUC magazine 63, pages 19+20);
None of the Megaram Ramdisks do have the separate Antic access
built-in, but XE-types can be upgraded easily for this mode!!;

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses
64k as main RAM and 192k as Ramdisk/extra RAM (therefore some
RD-testers will see 240k memory or 15 RD-banks which is untrue!);
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80); Basic: To be able to
select the internal Basic, connect a toggle switch between ground
and the motherboard where PB1 was removed (PIA `Hole' 11). The
switch is not much different than the Option Key, and I found it
more versatile. (Wes Newell) => see also ABBUC mag. 29, page 6+7;
Atari Basic: yes/no! XL/XE Selftest: YES! Antic access: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or
selfmade ones...) most likely do NOT have Antic access, due to
the lazyness of its creators or their intentions of simply not
needing it. However, original Newell Ramdisks created and sold
by Wes Newell do have the separate Antic access !!

- Newell Newell Ind. 4096k
4000-7FFF 0,1,2,3,4,5,6,7 B ($D301)

Notes: uses 8 pc. 4Mx1 Chips (541000-80); made by Newell, later by
FTE; seems to be very incompatible to existing software and
bankswitching cartridges (OSS, Atari, etc.), because normal RAM at
4000-7FFF is NOT available - only extra Ram/Ramdisk banks. With one
PIA chip there is simply no bit left to switch between main RAM and
extra RAM / Ramdisk. But with the installation of a second PIA chip
one would be able to do so. Furthermore one may use (almost) any
setup or banks he likes then (with a second PIA chip one could
control up to 256 Megabytes of RAM). Basic: To be able to select the
internal Basic, connect a toggle switch between ground and the
motherboard where PB1 was removed (PIA `Hole' 11). The switch is not
much different than the Option Key, and I found it more versatile.
(Wes Newell); OS: It is possible to maintain OS bankink using 4 Megs.
It requires moving the OS into RAM before any banking of that Bit
occurs. Use MOVEOS File on the [Newell-Software-] Disk. (Wes Newell)
Atari Basic: no! XL/XE Selftest: no (?) Antic access: no!

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (most RD-testers will therefore see 240k memory);
Antic access: no!, Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still the 64k main RAM plus this 256k extra RAM;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to TOMS-Ramdisk (?);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- Peterson 1088k S.Peterson 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: fully compatible to Newell and TOMS (?) Ramdisks;
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

=> Note that (separate) Antic access can be done to all Peterson
and compatible XE-type Ramdisks; just refer to Ed Bachman`s fine
article (supplied with the manual for the Wedge) on how to
update/upgrade your Peterson or compatible Ramdisk for Antic access;
(Afaik only XE-type computers can be upgraded for separate Antic
access, since XL-type computers don`t have the Freddie and Gate
Array chips; the Freddie chip controls the Gate-Array chip; the
Gate-Array chip is responsible for the separate Antic mode...)

- Quarter-Mega-XL C.Buchholz 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF (=newer version);
Notes: compatible to Peterson, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (therefore most RD-testers will see 240k memory);
older versions were designed for 32k banks, but with the appearance of
the 130XE as the new standard, the design had been changed to 16k banks;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Rambo XL ICD 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Peterson and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and uses 64k as main RAM and
192k as Ramdisk (therefore most RD-testprograms will see 240k memory);
built in Atari Basic: YES!, XL/XE Selftest: YES! Antic access: no!

- Rambo=>512k Dan Schmid 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 00,04,08,0C,20,24,28,2C,40,44,48,4C,60,64,68,6C, (Basic
80,84,88,8C,A0,A4,A8,AC,C0,C4,C8,CC,E0,E4,E8,EC; on??)
Notes: this "project" should upgrade a Rambo XL to 576kbytes;
the docs were found on Pooldisk Too (SUBDIR: ACE/Acec202 a+b);
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no (?)

- Satantronic`s 1MB PC-SIMM Ramdisk 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

C) Parallel-Bus-Devices:
(600XL/800XL = parallel bus, XE = cart-port + ECI and/or adapter)

- Turbo Freezer XL Bernhard Engl 256k
4000-7FFF 2,3,4,5,6 B ($D301)
Banks: E3,E7,EB,EF,93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF;
Notes: The Turbo Freezer XL is an external device for the XL-PBI
with its own Operating-Sytem. It has a built-in Freezer, Monitor
and DOS. The Antic access for the RD can simply be built with one
wire from CPU to PBI. The RD Access works with Port-Bits 2,3 for
Bank Switching, Bits 4,5 for Groups and Bit 6 for "Mode-Select".
PortB D7 = Selftest (0=on)
D6 = Mode (1 = XE, 0 = Groups)
D5 = XE: ANTIC-Access (0 = on), Groups: Group H
D4 = XE: CPU-Access (0 = on), Groups: Group L
D3 = Bank Number H
D2 = Bank Number L
D1 = BASIC ROM (0 = on)

D0 = OS ROM (0 = off)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: optional;

---

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, more 600XL Ramdisks, Rambo XL (512k by
ICD), some Irata Ramdisks, MIO, as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

For this 20th edition special thanks and credits go to: Lee Barnes,
Russ Gilbert, Mathy van Nisselroy, Erhard Puetz, Mathias Reichl,
Ron Hamilton, Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard
Pahl and Walter Lojek for sharing their info with me. Also thanks to
John Picken for writing an excellent article about ramdisks and
cartridges (especially about bank-switching, which both devices can
do). And thanks to Jindrich Kubec (Jindroush) for presenting this fine
article on his homepage... Finally thanks to Michael Current for
publishing/including this "spam" in his A8FAQ and all the nice Atarians
at comp.sys.atari.8bit for their help and patience. -Thank you Folks !!-
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or other things that might help, let me know. Please do also send
corrections since there will always be some updates and corrections
nescessary. Atarian Greetings - Andreas Magenheimer.

---

Subject: 8.11) What programs support a RAMdisk?

This section by Andreas Magenheimer.

8.11 Ramdisk-supporting Software:
(This is Version 2.10 from October 2003)

Well, I will only list those programs here that have BUILT-IN! ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a certain DOS or RD driver or b) has
a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected program)
into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any way.
The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs... Now, let me begin:

---

A) DOS programs:

a) Name(s) b) Author(s)
c) RD-type(s) d) max. size

- Atari DOS 2.0 (Atari Corp.) OSS/Atari;
a) Axlon-RDs (selfmade drivers!) 128k;
b) XE-RDs (selfmade drivers!) 130XE (=64k);
(there are some more selfmade RD-drivers available!)

- Atari DOS 2.5 (Atari Corp.) OSS/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) XE-RDs (selfmade drivers!) max. 2x128 kbytes;
c) Axlon-RDs (selfmade drivers!) 128 kbytes;
(there are very many selfmade RD-drivers available!)

- DOS 3.0 (Atari Corp.) ???/Atari;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen any (nor used DOS 3);

- DOS 4.0 (Atari/Antic) Michael Barall;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen them (nor used DOS 4);

- Bewe-DOS Bewesoft/J.Bernasek;
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Rambox (standard driver!) up to 256 kbytes;
(Bewe-DOS is compatible to Sparta-DOS but does not use the RAM
under the OS ROM! many tools can be used under both DOS versions);

- Bibo DOS Compyshop/E.Reuss;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

- DOS II+D Version 6.x Stefan Dorndorf;
a) XE-RDs (standard driver!) max. 2x128 kbytes;
b) Rambox (selfmade drivers!) up to 256 kbytes;

- DOS-XE (Atari Corp.) ???/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) other RDs (really?!?) unknown;
=> has the same author as the unpopular (Atari) DOS 3.0 !!;
(in the Atari scene it is as unpopular as DOS 3 and DOS 4!);

- DOS-XF (Atari Germany) Reitershan Comp.
=> similar in function to Turbo-DOS 2.1XF (but with a nice
DOS 2.0 / 2.5 DUP-menu! ) => see Turbo-DOS !!

- My-DOS 4.5x Wordmark/R.Puff+C.Marslett
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;
c) other RDs (MIO, BB, etc.) up to 1024 kbytes?;

- Smart-DOS Version 6.1 Ron Bieber;
a) XE-RDs (selfmade drivers!) up to 64 kbytes;
b) Axlon-RDs (selfmade-driver!) up to 128 kbytes;

- Sparta-DOS 1.x (400/800) ICD;
a) Axlon-RDs (??? drivers) up to 128 kbytes;
b) other RDs (??? drivers) up to ??? kbytes;

- Sparta DOS 2.x, 3.x (XL/XE) ICD / FTE;
a) XE-RDs (standard drivers!) up to 1024 kbytes?;
b) others (MIO, BB, etc.) up to 1024 kbytes?;
(maybe also RD-drivers for up to 16 Megabytes ?!?)

- Sparta DOS 3.3x (XL/XE) Stephen J. Carden;
=> see Sparta DOS 2.x and 3.x !!
(especially made for use with BBS-Express-Pro!)

- Sparta DOS X / 4.x (XL/XE cart.) John Harris/FTE;
=> see Sparta DOS 2.x and 3.x !!
(maybe with RD-driver for up to 16 Megabytes ?!?)

- Super DOS 2.x Paul Nichols;
a) XE-RDs (standard driver!) up to 128 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Super DOS 5.x Paul Nichols;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Top-DOS 1.x R.K. Bennett
a) Axlon-RDs (standard driver!) up to 128 kbytes;
b) 130XE-RD (standard driver!) 64 kbytes;
c) other RDs (Mosaic?! driver!) up to ??? kbytes;

- Turbo-DOS 1.x, 2.x Reitershan Comp.;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (MIO, Irata, etc.) up to 256 kbytes;

- X-DOS 2.x Stefan Dorndorf;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

---

B) Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- A-Base 130XE (TOOL) ??? (author unknown);
64k, 128k 130XE-Ramdisk;

- ABBUC-Magazine-Intro 52 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(has different intros on 64k / 128k machines!)

- ABBUC-Magazine-Intro 55 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(with different intros on 64k / 128k machines!)

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-Ramdisk;

- Alphasys-Sample-Software (TOOLs) (Mirage+ANG);
a) 64k, 128k 130XE-Ramdisk;
b) 320k 26AE = YES!, 8ACE = ???;
(there are several programs for 64k or 128k memory; there
is also one -and only one- program for 320k Ataris)

- Anime 4ever (DEMO) Sente-Software-Group;
64k, 320k 26AE ???, 8ACE ??? ;
(on 64k Ataris all pics load from disk, on 320k Ataris from Ramdisk)

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- A-Text (TOOL) ??? (author unknown);
64k, 128k 130XE-RD;

- Atari-Writer-80 (TOOL) (Atari);
48k, 64k, 128k 130XE-RD;

- Atari-Writer-Plus (TOOL) (Atari);
48k?, 64k?, 128k 130XE-RD;

- Basic-XE (TOOL) OSS/ICD/FTE
64k, 128k 130XE-RD;

- Bop N'Wrestle (GAME) (Mindscape)
64k, 128k 130XE-RD
(on 64k Ataris the floppy will never stand still!)

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;
(merely copies the levels into the RD and loads them from there;
if you don't want to play all 100 levels at once, 64k is enough!)

- Datei 4.x (database TOOL) Norbert Schlia;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Desktop Atari (TOOL) H.B.S.F
64k, 128k RAM 130XE-RD;
(the Key "7" in the Main Menu copies the whole program into the RD)

- Diskcomm. 2.x, 3.x (TOOL) Robert "Bob" Puff;
a) extra RAM (answer with Yes) detects up to 10 banks (hex.)?;
b) Ramdisk (answer with No) all DOS 2, My-DOS and Sparta RDs;
(Ramdisk size depends on the DOS and RD driver you are using, i.e.
with TurboDOS up to 256k, with MyDOS or Sparta maybe up to 1 Megabyte)

- Diskworker 130XE (Tools) PETSOFT
64k, 128k RAM 130XE-RD;

- Extended-Atari-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Extended-Turbo-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Fampy 2.3 (Bootdisk; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Fampy 6.1i+ (ML-File; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Grafik+Sound Demo (DEMO) Dendrit-Soft/P.Sabath;
(48k?) 64k, 128k 130XE-Ramdisk;

- Howfen-DOS 3.x, 4.x (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Howfen-Tape-to-Disk (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Human Torch & The Thing Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk
(The main program or some pics will be copied to the Ramdisk)

- Inertia 2.9 (TOOL) Mad Team;
a) 64k RAM (16k only) 16k usable memory (1 bank);
b) 128k RAM (16k+64k) 130XE-Ramdisk; (5 banks);
c) 320k RAM (16k+256k) 26AE & 8ACE RDs (17 banks);

- I.K. Plus Demo (GameDEMO) ??? (authors unknown)
a) 64k RAM only graphics;
b) 128k RAM graphics + sound;

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Midi-Mate II (Tool) Hybrid Arts;
64k, 128k 130XE-Ramdisk;

- Midi-Pattern-Editor (TOOL) Raster/Radek Sterba;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE-RDs?;

- Midi-Player (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Recorder (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Sequencer (TOOL) Maciej Sygit;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- MSC-IDE interface software (TOOLs) M.Belitz+S.Birrmanns;
64k, 128k 130XE-Ramdisk
(some programs/drivers use the Ramdisk, if no Ramdisk is
available, they will use & erase the RAM area 4000-7FFF)

- [The] Muppet-Movie (DEMO) Mad Team;
64k, 128k 130XE-Ramdisk;
(on 128k Ataris some pics are loaded from the Ramdisk)

- [The] Page Designer (TOOL) XLent
64k, 128k 130XE-Ramdisk;

- Paperclip II (TOOL) Batteries Included;
48k?, 64k, 128k 130XE-Ramdisk;

- Questprobe featuring Spiderman - see: Spiderman;
(afaik, THE HULK does not support 128k RAM);
- Questprobe featuring Human Torch and Thing - see Human Torch;

- Spiderman Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk;
(The main program or some pics will be copied to the Ramdisk)

- Sweet Fantasy (DEMO) Tight;
64k, 128k 130XE-Ramdisk;
(on 128k machines the gr.9 pics are loaded from the ramdisk,
on 64k Ataris the gr.9 pics are loading from the disk drive);

- Syncalc "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synfile "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synhome "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

(other programs by Synapse should also support Axlon-Ramdisks)

- Textpro 5.x (TOOL) Ronnie Riche;
48k, 64k, 128k and more 130XE-RD, 26AE & 8ACE RDs;
(here the RD-bank Macros *.ADN and/or *.BNK will require extra RAM
/ Ramdisk; simply don`t use them if you merely have 48k or 64k !!)

- The Browser (TOOL) CTH / Tom Hunt;
64k, 128k and more all Sparta-DOS Ramdisks;

- The Top-3 Demo (DEMO) W.F.M.H.;
64k, 128k 130XE-Ramdisk;
(the dancing girl -"Veronika"- supports 64k and 128k memory!)

- Typesetter XL/XE (TOOL) XLent;
64k, 128k 130XE-Ramdisk;

- [The] X-Files Shpoon;
64k, 128k, 320k 130XE-RD, 26AE or 8ACE RDs?;

- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means 128k memory (64k RAM + 64k RD);
- AE means 192k memory (64k RAM + 128k RD);
- 26AE means 320k memory (64k RAM + 256k RD)
=> Compyshop types (and compatibles, like Mathy`s RD);
- ACE means 256k memory (64k RAM + 192k RD)

=> Newell, Buchholz, Peterson, Rambo XL (and compatibles);
- 8ACE means 320k memory (64k RAM + 256k RD)
=> Newell?, TOMS, Peterson, Rambo XL? (and compatibles);
- ? means I am (generally) unsure -or:- I am not sure if
the given information is correct (just check it out!);

Thats all for now. Thanks and credits go to Russ Gilbert, Lee Barnes
Bernhard Pahl and Mathy van Nisselroy for sharing some info with me.
Any further help or info is welcome !! -Andreas Magenheimer.

---

Subject: 8.12) What programs require a RAMdisk?

This section by Andreas Magenheimer.

8.12 Atari-programs that require Extra-RAM / Ramdisk:
[This is version 2.10 from October 2003]

A) Non-Demo-Programs:

a) name(s): b) author(s):
c) memory (min.): d) RD-Type(s):
e) notes

- 130XE-(Bank-)Tester (TOOL) various authors (PD);
128k memory (64k RAM + 64k RD) 130XE-Ramdisk (E3,E7,EB,EF);
(1 block with 4 banks, overall: 4 banks);

- 192k-Memory-Tester (TOOL) various authors (PD);
192k memory (64k RAM + 128k RD) A,E Ramdisk blocks;
(2 blocks each with 4 banks, overall: 8 banks);

- 256k-Memory-Tester (TOOL) various authors (PD);
256k memory (64k RAM + 192k RD) A,C,E or 8,A,E blocks;
(3 blocks each with 4 banks, overall: 12 banks);

- 320k-Memory-Tester (TOOL) various authors (PD);
320k memory (64k RAM + 256k RD) 8,A,C,E or 2,6,A,E blocks;
(4 blocks each with 4 banks, overall: 16 banks);

- 576k-Memory-Tester (TOOL) various authors (PD);
576k memory (64k RAM + 512k RD) (overall: 32 banks);
(8 blocks x 4 banks -or- 4 blocks x 8 banks);

- 1088k-Memory-Tester (TOOL) various authors (PD);
1088k memory (64k RAM + 1024k RD) (overall: 64 banks);
(4 blocks x 16 banks for Mathy van Nisselroy`s RD and maybe others);
(8 blocks x 8 banks for Newell, Peterson, TOMS and compatibles);
(16 blocks x 4 banks should also be possible, but do not exist yet!);

- 2112k-Memory Tester (TOOL) Satantronic`s XRAM 0.18;
2112k memory (64k RAM + 2048k RD) (overall: 128 banks);
(8 blocks x 16 banks -or- 16 blocks x 8 banks);

- 4160k-Memory-Tester (TOOL) ??? (authors unknown);
4160k memory (64k RAM + 4096k RD) (overall: 256 banks);
(16 blocks x 16 banks, means blocks 0-F each with banks 0-F);
(note: with 1 PIA chip the main RAM 4000-7FFF is not available!);

- 8256k-Memory-Tester (TOOL) ??? (authors unknown);
8256k memory (64k RAM + 8192k RD) (overall: 512 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

- 16448k-Memory-Tester (TOOL) ??? (authors unknown);
16448k memory (64k RAM + 16384k RD) (overall: 1024 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

=> Note that 2MB-16MB extra RAM / Ramdisks are very uncommon
in the Atari scene! These upgrades were once sold by ICD and
Newell (maybe a few ones also by FTE) and of course they were
and still are selfmade by some crazy Atarians. It is not clear
if there is any software (games, apps., demos) available, that
supports these mega-upgrades fully. Afaik, only few Atarians
have and use them, mostly users of mailboxes / BBS`es...;

- APC-Archiver 1.0 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- APC-Packer 1.1 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- Atari Writer Plus Super Menu Ken Siders;
a) AWP + Super Menu 128k RAM 130XE-Ramdisk;
b) AWP-XE + Super Menu 256k RAM 26AE = ???, 8ACE = ???;

- ATOS/ATari Operating System (TOOL) CTH / Tom Hunt;
64k RAM + 16MB-HDD-Partition all Sparta-DOS Ramdisks;
(the standard system is configured for a 16MB harddisk partition,
however it is possible to change this and use an Atari with a big
floppy drive and/or ramdisk; but this requires quite some work!)

- Audio/Studio Master ANG/Mirage;
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Boot-Majster (TOOL) Electron;
128k RAM 130XE-Ramdisk;

- Boss-X - Version 10.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- Boss-XE - Version 8.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- CAD-XE (TOOL) (HAPS-PD 0350);
128k RAM 130XE-Ramdisk;

- Castle of Blackthorne (GAME) L.o.D. / Thimo Graef;
128k RAM 130XE-Ramdisk;

- Cavepack (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Computer Baseball (GAME) Douglas Blackwell
128k RAM 130XE-Ramdisk

- Degas-View-XE (Tool) Mat*Rat / Mathew Ratcliff;
128k RAM 130XE-Ramdisk;

- Diskettenverwaltung 130XE (TOOL) (ABBUC PD 86);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Draw XE (TOOL) (ABBUC PD 387);
128k RAM 130XE-Ramdisk;

- Dream Vision (TOOL) (ABBUC PD 480);
(IFF-Viewer) 256k RAM 26AE = YES!! ; 8ACE = ??? ;

- Filemanager/Filecopiers (TOOLS) various authors (PD);
128k=> 1 floppy is enough Sparta and DOS 2.x RD`s;

- Fraktale & Colorprint (TOOLS) (ABBUC PD 349); P.Woetzel;
(fractals & colorprint) 128k RAM 130XE-Ramdisk;

- Gizmo`s Castle (GAME) Black Panther / M. Kugler
XE-Version = 128k RAM 130XE-Ramdisk;

- Grafik-Zeilen-Editor (TOOL) (HAPS PD 0296);
(graphic-line-editor) 128k RAM 130XE-Ramdisk;

- Hi-Res Designer (TOOL) (HAPS PD 0015);
(gr.8 drawing program) 128k RAM 130XE-Ramdisk;

- Hires-Dump (TOOL) (ABBUC PD 113);
(gr.8 print-program) 128k RAM 130XE-Ramdisk;

- Inertia 4.5 (MODplayer TOOL) MadTeam
a) 128k RAM 130XE-Ramdisk
b) more than 128k RAM 26AE = YES!, 8ACE = YES!;

- Kaiser II (GAME) Phoenix Softcrew / C.Strotmann;
a) 64k RAM Version any 64k XL/XE computer;
b) 128k RAM Version 130XE-Ramdisk;
c) 320k RAM Version 26AE = YES!, 8ACE = YES!;
(this game comes in 3 separate versions; plays good on 64k
computers, but needs less disk-swaps on bigger machines !!)

- Kassettencopy (TOOL) (ABBUC PD 466); J.Gernreich;
(Cass.copy) Copy64 = 128k RAM 130XE-Ramdisk;

- Kemna-Video (TOOL) (ABBUC PD 185);
(intro-creator) 128k RAM 130XE-Ramdisk;

- Koala Slideshow XE (TOOL) Charles Johnson/Analog
128k RAM 130XE-Ramdisk

- Koenigsdiamanten (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Lightraces (Game) (Power per Post);
XE-Version = 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE 4.32 (TOOL) (ABBUC PD 297); T.Karwoth;
(older version!) 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE+ 2.x (TOOL) (ABBUC PD 368); T.Karwoth;
(newer version!) a) 128k RAM 130XE-Ramdisk (MyDOS only!);
b) 128k - 1088k (MyDOS only!) 26AE = YES!! ; 8ACE = YES!! ;
(has a rambank-finder program that can be loaded from Basic or the
menu!; the assembler does not work on a CS ramdisk with refresh bugs!)

- Masher-XE V1.0 ??? (author unknown);
minimum 128k RAM 130XE-Ramdisk;
192k, 256k and max. 320k RAM AE, ACE and max. 8ACE RDs;

- Memdrv10 (RAM-Tester TOOL) Andre 'MacFalkner' Bertram
$D301 all Portbits 16k up to 4 MB (all standard RD`s);
$D600 up to ??? MB (Klaus Peters Megaram 3 Ramdisk)
includes 16k Bankswitching and exotic 32k (Buchholz) Bankswitching

- Menu 130 (TOOL) Les Howarth/Page 6
128k RAM 130XE-Ramdisk

- Midi Mate III Hybrid Arts;
128k RAM 130XE-Ramdisk;

- Minesweeper 1-4 (GAMEs) J.R.Chiko/S.A.S.;
128k RAM (4 game versions) 130XE-Ramdisk

- Mister X (Game) (Power per Post);
128k RAM 130XE-Ramdisk;

- Monitors, Debuggers & more (TOOLS) (HAPS PD 0109);
some programs require 128k RAM 130XE-Ramdisk;

- Multi-DOS 130 (TOOL) Kuchera/Excellent;
128k RAM 130XE-Ramdisk;

- Multi-DOS 320 (TOOL) Kuchera/Excellent;
320k RAM 26AE = ???, 8ACE = ???;
(note that Multi-DOS 130 and 320 are no DOS-Versions, they can
be used as *.CMC players; all the rest is unknown to me...)

- Multi-Tasking-OS (various ABBUC magazines);
128k RAM minimum 130XE-Ramdisk (+ST-mouse);

- MTOS XE (Tool) CTH / Tom Hunt;
128k RAM 130XE-Ramdisk;

- MTOS 256 (Tool) CTH / Tom Hunt;
256k RAM (64k+192k) 26AE = NO!! , 8ACE = YES!!;

- [Der] Neffe (Game) (ABBUC PD 52);
(the Nephew) XE-Version = 128k RAM 130XE-Ramdisk;

- Neo-Tracker (TOOL) EPI/Allegresse;
192k RAM minimum 26AE = ??? , 8ACE = ???;

- [The] Newspaper-Editor (TOOL) (HAPS PD 0294 english!);
XE-Version = 128k RAM 130XE-Ramdisk;

- Oelbaron (Game) ??? (author unknown);
XE-Version = 128k RAM 130XE-Ramdisk;

- Programmverwaltung 130XE (TOOL) (HAPS PD 0434);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Protracker 1.5 (TOOL) MadTeam;
128k RAM minimum 130XE-Ramdisk;

- (various) Ramdisk drivers (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- Rechnen fuer Kinder (TOOLs) (ABBUC PD 85);
(calculations for children) 128k RAM 130XE-Ramdisk;

- Rund um die Ramdisk (TOOLs) (ABBUC PD 383, HAPS PD 1084);
(RD-testers, etc.) 256k RAM and more various XE-RD`s & Axlon-RD`s;

- Sample-Art-XE Mozart/WSL
a) minimum 128k RAM 130XE-Ramdisk;
b) more than 128k RAM 26AE = ???, 8ACE = ???;
(on my 576k-XL the program has some gr.-bugs and crashes very often!)

- Shrink-XE Peter Fitzsimmons;
min. 128k RAM 130XE-comp.-Ramdisks;

- [The] Small Printery (TOOL) Walter Lojek;
128k RAM or more (up to 1MB) 130XE-Ramdisk (minimum!);

- Snapshot (Tool) ??? (author unknown);
128k RAM 130XE-Ramdisk;

- [The] Sound-Utility (TOOL) CTH / Tom Hunt;
(64k), 128k, 256k, 576k, 1MB 130XE-RD; 8,A,C,E Ramdisks;

- Space Harrier (Game) Sheddy / Chris Hutt;
128k RAM 130XE-Ramdisk;

- Strategy Baseball (Game) (HAPS PD 0302);
128k RAM 130XE-Ramdisk;

- Studio/Audio Master ANG/Mirage
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Super-Print-Lab-XE (TOOL) (HAPS PD 0909);
(demo-version) 128k RAM 130XE-Ramdisk;

- System+Memory Tester (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- T-34 (Game) (ANG / Mirage);
128k RAM 130XE-Ramdisk;

- (various.) Tape-Copiers (TOOLs) various authors (PD);
128k RAM 130XE-Ramdisk;

- Tape-Ramdisk-Drivers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- Text-130 (TOOL) B.Russmann;
128k RAM 130XE-Ramdisk;

- Textpro "+" (TOOL) Ronnie Riche;
(e.g. Vers. 4.54+) 128k RAM 130XE-Ramdisk;

- The Code Cruncher (TOOL) Soused Teat / A.Bienias;
128k RAM and more XE-Ramdisks;

- The Cruncher 5.0 (Tool) MSL / Magnus;
128k RAM and more XE-Ramdisks;

- The [Sparta DOS] Wedge (TOOL) Ed Bachman;
128k RAM and more + sep. Antic! XE-RD`s with separate Antic!;

- The Works (Tool) CTH / Tom Hunt;
128k RAM and more 130XE and A,C,E Ramdisks;

- [Die] Wuerttemberger-Disk (TOOLS) (ABBUC PD 361, HAPS PD 1050);
also contains the XE-version of Gizmo`s castle => see Gizmo`s Castle!;

- (various) XE-Sectorcopiers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- XE-Utilities (10 XE-TOOLs) (HAPS PD 0031);
128k RAM 130XE-Ramdisk;

- XL-2 (Tool) John K. Picken;
128k RAM and more all Sparta und DOS 2.x RD`s;

- Zargon (german text-adv. GAME) (ABBUC PD 611, HAPS PD 0485);
128k RAM 130XE-Ramdisk;

- [Der] Zeitungsredakteur (ABBUC PD 121, german!);
(newspaper-editor) 128k RAM 130XE-Ramdisk;

---

B) Demo-Programs:

- 130XE-Artshow (Koala!) (HAPS PD 0013);
128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Autoshow (Oldtimers!) (ABBUC PD 191, HAPS PD 0637);
(130XE carshow) 128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Demo S.A.G. (Netherlands);
128k RAM 130XE-Ramdisk;
(written in TB; change all D8: entries into D1: for use with 48k and
64k Ataris; exchange Turbo-Basic XL with TB 3.2q, TB 400 or Frost
Basic for use with older 48k Ataris or (most versions of) Sparta-DOS)

- 130XE-Impossible-Demo Rudy Haegemann / V.T.B.;
128k RAM 130XE-Ramdisk;

- Amiga-Boink-XE Bob Armour;
128k RAM 130XE-Ramdisk;

- American Natives Fox-1 / R.Verdaasdonk;
256k RAM all DOS 2 und MyDOS RD`s;

- (X-Files) Animation-Demo Mad Team;
128k RAM ($04 banks / $4b frames) 130XE-Ramdisk;
(the real name of this demo is unknown to me; maybe it is also called
X-Files-Demo, like the X-Files (picture) demo by Sphoon, maybe it has
a different name; on all tested XL/XE Ataris this demo has graphic bugs)

- Animkomials meet Boris Valleyo Animkomials+Boris Valleyo;
128k RAM (gr.9+11 pictures!) 130XE-Ramdisk; (has a setup!);

- Base-33 AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT upon bootup to get to the Setup-menu!)

- Bill-Pie-Demo ??? (maybe Mad Team?);
a) 128k RAM ($1E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($36 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($4C frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop or compatible RD can merely see the 192k version!)

- BMW-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- CES-XE-Demo XANTH (full version);
128k RAM (580 sectors) 130XE-Ramdisk;

- Cogito-Demo AIDS / AIDZ;
192k RAM 26AE = no?! ; 8ACE = YES!! ;

- Comet-Ani MadTeam;
a) 128k RAM ($36 frames) 130XE-Ramdisk; RD-block E;

b) 192k RAM ($6D frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($96 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Critical-Sound-Demo Innovative;
128k RAM 130XE-Ramdisk;

- Danielle-(Gr.9-TB-)Ani NBS / Bill Kendrick;
a) 64k RAM (499 sectors) Disk = very slowww!;
b) 128k RAM or Harddisk RD/HD = much faster !!;
(=> use your favourite DOS, Turbo-Basic and a RD/HD driver!)

- Edelweiss-Demo A.R. + C.S.S. + S.V.L.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s you can see all demo-parts, however the mainpart,
known as the Edelweiss-Digi-Sample is shorter & sounds strange!)

- Ergo-Bibamus Quasimodos;
128k RAM (with Setup!) 130XE-Ramdisk;
(well, for 130XE and compatible Ramdisks no setup needed!)

- Extract-Slideshow Bit Busters / Replay;
128k RAM 130XE-Ramdisk;

- Glasshead / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Halle 1994b: The Wormhole Magic Arts;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;
(well, this demo does not work at all on 8ACE-Ramdisks!)

- (Atari) Hardware-Demo A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Igor Demo MadTeam;
a) 128k (Part 1, Part 2) 130XE-Ramdisk;
b) 192k (Part 3) 26AE = YES!! ; 8ACE = YES!! ;
c) 320k (Parts 1+2+3) 26AE = NO!! ; 8ACE = YES!! ;
(=> the demo normally runs a setup for 320k memory; but there are 2-3
batch files for each Setup; goto DOS and install the one you want or
need with the JOB command: JOB @xxxx.BAT [RETURN], then reboot disk)

- Imperial (Sounddemo) Innovative;
320k RAM 26AE = YES!! ; 8ACE = YES!! ;

- Impossible but Real! MacGyver / AIDS;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> press A for 8ACE-RDs, press B for manual setup of other RDs)

- Isolation Demo Masters of Electric City;
128k RAM 130XE-Ramdisk;

- Journey Polynomials
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = YES!! ; 8ACE = yes!? ;
(=> this demo chooses the Ramdisk & Setup automatically! the demo
has quite some graphic bugs on 8ACE ramdisks, but is viewable!)

- Journey into Sound DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- Khai-Et AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT key upon bootup for the Setup-menu)

- Killer-Whales MadTeam
a) 128k RAM ($2E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($54 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($94 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Lajf-Demo MadTeam;
128k RAM 130XE-Ramdisk;

- Landscape-XE-Demo Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Megablast-Sounddemo DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- MTV`s-Danielle see: Danielle-Ani.;

- Nascar-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- Nonjm-Demo TIGHT;
128k RAM 130XE-Ramdisk;

- Numen-Demo Taquart;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the newer/updated version has an auto-setup for 26AE & 8ACE RD`s!)

- Owca-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Owca-2-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Parrot-X-MAS-Demo Anthony Ramos;
128k RAM 130XE-Ramdisk;

- Pedrokko-Sounddemos Pedrokko (10 Disks / 20 S.);
128k RAM (some demos) 130XE-Ramdisk;

- P.I.T. - Demo Quasimodos;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> a menu appears automatically; setup 15 banks to run the demo!

this demo does not work correct on Ramdisks with refresh-bugs!)

- Raving Vierpz Pentagram;
128k RAM 130XE-Ramdisk;

- Raytracing 320k Elsni/Stephan Elsner;
320k RAM (TB listings!) 26AE = NO!! ; 8ACE = YES!! ;

- Raytracing 1MB Solocoder of A.C.E.;
1088k RAM (K.Peters Megaram 3) works only on K.P.-1MB-RD !!;
(=> Bootdisk with 8 disksides; loading time: approx. 17 minutes!)

- Raytracing Animation Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Revenge of Hacker Rasero Team;
192k RAM (RD-blocks A+E) 26AE = YES!! ; 8ACE = YES!! ;

- Sweet Fantasy TIGHT;
128k RAM 130XE-Ramdisk;

- Sheol Bit Busters;
320k RAM 26AE = NO!! ; 8ACE = YES!! ;
(on 26AE / CS - Ramdisks you will merely receive an error
message like this: sorry, this demo needs 256k of xms RAM)

- Shiny-Bubbles-XE Brian Paul / LACE;
XE-Version = 128k RAM 130XE-Ramdisk;

- Stash-Demo Rasero-Team;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> in the first menu press A for 8ACE Ramdisks or press B for
manual setup of other Ramdisks like Compyshop; in the second menu
press A for 8ACE Ramdisks or C for manual input of Rambanks; don`t
press B -Compyshop- here, since this CS setup is faulty/wrong)

- Starwars-Demo A.R. + C.S.S.;
320k RAM (hold down Option-Key!) 26AE = YES!! ; 8ACE = yes!? ;
(the program checks if Basic is disabled via the Option key, thus
an OS with inverted Basic / Option-key function does not work here!;
with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- The Asskicker Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- The Turtles-Demo (Animation!) Ultra-Software;
128k RAM 130XE-Ramdisk;
(the file version by John E. requires 128k, maybe this bootdisk also)

- The Wormhole Magic Arts;
320k RAM 26AE = YES!!, 8ACE = NO!!;
(this demo is part of the Halle Project 1994 demo, side B!)

- Timekeep(er) New Generation;
320k RAM ??? 26AE = NO!! ; 8ACE = YES!! ;

(after loading on an 8ACE-RD be patient! the demo requires some time
for depacking - don`t switch off when you see a black screen, wait!)

- Tit-Demo MadTeam;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the Setup appears automatically; accept or change it !)

- Too-Hard-2 Animkomials (Rippers!);
128k RAM 130XE-Ramdisk;

- Too-Hard-3 Animkomials (Rippers!);
192k RAM 26AE = YES!! ; 8ACE = YES ;
(=> the Setup appears automatically; accept or change it!)

- Too-Hard-4 Animkomials (Rippers!);
320k RAM 26AE = YES!!, 8ACE = YES!!;
(=> the Setup appears automatically; accept or change it!)

- Total Daze TIGHT;
128k RAM 130XE-Ramdisk;

- Trabant Demo / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Trip-6-Demo Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- Ultra Taquart;
128k RAM 130XE-Ramdisk;

- Vengeance Excellent;
128k RAM 130XE-Ramdisk;

- Vent Excellent+Pentagram;
128k RAM 130XE-Ramdisk;

- Video Blitz Helvetica Bold;
128k RAM (+sep. Antic!) 130XE-Ramdisk + sep. Antic!;

- WAF-Demo (Side B) ABBUC regional group W.A.F.;
128k RAM (2 Parts!) 130XE-Ramdisk;
(=> here the Raytracing and Vector part require 128k memory!)

- Worms-Demo Datri;
320k RAM 26AE = yes!? ; 8ACE = YES!! ;
(with 8ACE-RD`s you see the complete+bug-free version; with 26AE
RD`s you see a shorter and very buggy version with many deja-vues!)

- X-Demo Mad Team;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;

- Xyberscape-XE Bill Le Masurier;
128k RAM 130XE-Ramdisk;

- Zero-Demo New Generation;
128k RAM 130XE-Ramdisk;

---

Notes: - 256k Compyshop-Ramdisks, 256k K.Peters-Megaram 1,2,3
and Mathy`s 1024k RD have/use 26AE Ramdisk blocks;
- afaik all other 192k / 256k Ramdisks have ACE (8CE)
or 8ACE blocks (Newell, Peterson, Buchholz, TOMS, etc.);
- ??? means unknown; TB means Turbo-Basic (XL);
- HTPPD means Hobby-Tronic-Power-Pack-Demo;
- YES!! means the demo works as it should (100% correct);
- yes!? means the demo works but has some bugs or is shorter
(50-80% correct);
- no?! means the demo almost does not work and has many bugs
(10-40% correct);
- NO!! means the demo does not work at all - it refuses to load
or crashes shortly after loading (0% correct);
- sep. Antic means separate Antic access of the Ramdisk;
(only 2 programs seem to exist: Video Blitz & The Wedge);

Thanks and credits go to Russ Gilbert, Bernhard Pahl and Mathy van
Nisselroy for sharing their info with me. Any corrections and/or updates
are welcome... - Andreas Magenheimer

---

Subject: 8.13) What voice/sound synthesis software is there for the Atari?

This section by Andreas Magenheimer.

- S.A.M. - the Software Automated Mouth by Don't Ask Software (a
software package; you can find it at Don`s / the author's homepage:
http://www.retrobits.net)
- Softsynth (a PD program, that creates sounds and sound effects via
modulation of the tv/monitor speaker; available from the ABBUC library);
- MOD-Sounds (sound-MODulation, allthough I do not know any software to
create such sounds on an A8, some programs to edit (Protracker) and
playback (Inertia, Modplayer, Neotracker, etc.) these sounds do exist);

---

Subject: 8.14) What programs support stereo and upgraded sound?

This section by Andreas Magenheimer.

There is already a lot of stereo software for the upgraded Atari computers
available, of course most of these programs are limited to certain/special
upgrades and merely perform their stereo effects on these items (with
otherwise upgraded or non-upgraded Ataris, the sounds or programs will
only play in mono):

a) software for the various stereo-upgrades:

- stereo with one Pokey (POPS-software): Afaik for this kind of upgrade, there merely exists a patched version of the Pokey player program, I am not sure if there is anything else for it; anyway, refer to Analog Computing, issue 66, november 1988, pages 54 -60;

- stereo with two computers (thus two Pokeys): Afaik for this simple trick there merely exist two programs, they are "Perestroyka" and "Sky Network" by T.Liebich. In order to achieve the stereo effect, you have to boot/load one of these demos on two computers (connected to different TV's or monitors, there is no need to connect the computers to each other!). When done, press 1-5 on the first computer while pressing Shift-1-5 on the second computer. Meaning, if you want to hear the first sound in stereo then press 1 on computer 1 and press Shift-1 on computer 2 simultanously (that`s a little tricky, I know). If you want to hear sound 5 in stereo, then press 5 on computer 1 and Shift-5 on computer 2 simultanously. Tricky at first, but sooner or later you will get the hang of it. Of course you can also connect the two Ataris to a hifi-system, using the sound output of one Atari for the left channel and the sound output of the other Atari for the right channel...

- stereo-sound with Stereo-Blaster Pro (Portronic/AMC): Afaik there was at least one demo disk (early version was single-sided only, later versions were double-sided), that contained some demo-software, namely the simple "Stereo-demos" (by AMC, side 1) and the "Stereoblaster-Demo" (by HU-Soft, side 2 if available). The Stereoblaster demo was written in Turbo-Basic and played back via Compiled-Turbo-Basic, it uses Chaos Music-Composer Sounds (*.CMC) and a few of these provide stereo effects, if equipped with a stereo-blaster-pro and a hifi-system. The simple stereo-demos included some programs written in Atari Basic, for example a (pong-like) bouncing ball and a flying helicopter. Equipped with a stereo-blaster-pro and a hifi-system, one could see the ball bouncing left and right and simultanously hear the sound fx on the left or right channel. The helicopter started at the left side and produced a loud sound on the left channel, when it was flying to the right side, the sound faded on the left channel and got louder on the right channel, until the helicopter disappeared (and the sound completely faded away). There were some more of these simple demos available, but I don`t remember them anymore.

- Stereo with two Pokeys: There already exist dozens of sounds and demos, that support this upgrade, most of these programs were made in Poland, but a few sound-demos were also made in other countries. Anyway, the following programs support stereo via two Pokey chips:

- Alf-Demo by the Unknown Base (Netherlands);
- Alpha-Demo by GMG (Slovakia);
- AMS-Stereo player by ??? (author unknown), USA;
(there are at least two AMS-stereo-players, that let you play *.AMS sounds in true stereo or at least simulated stereo!);
- ARS-Mori 16k Intro by Tristesse (music shortened and ripped from Drunk Chessboard by Infinity!), Poland of course;
- Ballada sound by DJ V / BK (Poland);

- Base 33 by AIDS (msx by Greg, Poland);
- Chaos Music Composer version x.x patched by ??? , Poland;
(=> the original version by Janusz Pelc / LK Avalon is only mono,
but there is a patch available, as well as various patched CMC
versions on the internet; thus *.CMC sounds can be generated in
stereo!);
- (many) *.CMC sounds created by one of the many stereo-versions of
Chaos Music Composer;
- Cogito-Demo by AIDS (Poland)
- Do you see the light? sound-demo by Roemer of UNO (Germany);
- Draconus, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- Drunk Chessboard by Infinity (music by X-Ray!), Poland;
- Dynakillers (Game) by GMG, Slovakia;
- First of All (sound) by Raster, Czech Republic;
- Impossible but Real Demo by MacGyver (Poland);
- King of Aggregat by X-Ray / Slight (Poland);
- Megaplayer Versions 1.6 and 2.0 by MacGyver (Poland)
(=> and thus all *.CMC, *.MPT, *.TMC, etc. sounds played with
this sound-player tool can be heard in true or simulated stereo!);
- Multi-Pro-Tracker 2.4 (various versions) by Jaskier/Taquart?
(=> thus *.MPT sounds can be generated in stereo!), Poland;
- (many) *.MPT sounds created by the stereo-version of Multi Protracker;
- Nazebany by DJ V / BK (Poland);
- Overload sound by X-Ray / Slight (Poland);
- Raster Music Tracker 1.x by Raster, Radek Sterba (a PC program
that creates mono/4-channels or stereo/8-channels *.RMT sounds that
can be played back on the A8 or any Atari 800/XL/XE emulator);
- (most) *.RMT sounds created by Raster Music Tracker;
- Stereo-Patch for Pokey Player by ??? (author unknown)
(=> thus all Pokey-Player / *.V sounds can be heard in stereo!);
- Stereo-Patch for Softsynth by Freddy Offenga (Netherlands)
(=> thus Softsynth will create stereo-sounds!);
- Stereo Patch for World of Wonders by Freddy Offenga (Netherlands)
(World of Wonders is a great Softsynth sound-demo!);
- Still Alive (TMC-sound) by Greg, Poland;
- Time sound by X-Ray / Slight (Poland);
- Theta-Music-Composer version 1.x by Greg (Poland)
(=> thus *.TMC sounds can be generated in stereo!);
- (most) *.TMC sounds created by Theta Music Composer;
- Vanity sound by Kuchara / Excellent (Poland) ;
- Worms (320k-Demo) by Datri, Czech Republic;
- Zybex, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- thats all what I found so far... (A.M.)

b) software for other sound enhancements:

- enhanced-sound with Covox: Afaik this upgrade will playback digitised or
sampled sound in 8Bit resolution rather than in 4Bit resolution. The
following programs support the Covox-Upgrade:

- Inertia 2.9, a MOD-player by MadTeam;
- Inertia 4.5, a MOD player by MadTeam;
- Protracker x.x, a MOD-editor and player by ???;
- NeoTracker 1.x, a MOD+NEO+... player by EPI/Allegresse;
- that's all I have found so far;
note that all programs (except neo-tracker?) will still work with pokey...;

---

Subject: 8.15) What games support online action via modem?

This section by Andreas Magenheimer.

- Modem Chess, a PD game in Basic by ???
- Modem-Battleships, a PD game in Basic by ???
- Tele-Chess, a PD game in Basic by ???
- probably some more games...

(I have also seen an advert from GCP in Analog or Antic, that listed
the following games: The City, Cybertank, Cybership, Bio-War, Lords
of Space; I am not sure if they are all available for the Atari, A.M.)

To play these games online, one would not only require an Atari computer,
but also a modem, a modem-driver and/or a terminal program (like Kermit,
Bobterm, Teleterm, A-Term, Ice-T, BBS Express Pro, etc.). See also the
sections 7.8, 10.1 and 10.2 which tell you more about modem/terminal
programs and modem hardware for the Atari...

---

Subject: 8.16) What programs support Atari computer networking?

This section by Andreas Magenheimer.

There are two different hardware add-ons which provide a "computer-
network" (two or more Ataris linked together). Thus, there is software
that supports either one or the other hardware (namely Gamelink-1 or
Gamelink-2). The following software supports the networking hardware:

- Gamelink-1 (by Dataque):
- info-text about GL-1 and where to buy it, by Dataque;
- Tic-Tac-Two by J.Potter/Dataque, a tic-tac-toe clone;
- Modem-Battleships, patched by Rick Detlefsen for Gamelink-1;

- Gamelink-2 / Multilink (by Dataque & Bewesoft):
- info-text about GL-2 and where to buy it, by Dataque;
- info text about Maze of Agdagon demo, by Dataque;
- Maze of Agdagon demo (1 player only) by Dataque;
- documentation for Maze of Agdagon (full version) by Dataque;
- Maze of Agdagon (full version, 2-8 players) by Dataque;
- description of multilink/gamelink-2 hardware and schematics by
Bewesoft (two texts, one in czech and one in english; schematics
presented as an Atari Gr.8 picture for a) easy-2-computer hardware
and b) more complicated 2-8 computer hardware);

- Multi-Dash (2-8 players, XL/XE only) by Bewesoft;
- Multi-Race (2-16 players, XL/XE only) by Bewesoft;
- description of "how to program networking games for multilink
[gamelink-2] hardware" (text available in english and czech, with
lots of source codes and OS adresses/variables/...) by Bewesoft;
- Multi-Worms (2-8 or 2-16? players, XL/XE only) by Bewesoft;
- complete + documented source code for Multi-Worms by Bewesoft;
- "starter-kit" module to use in your own networking-games by Bewesoft
(free use of this module is granted by Bewesoft/Jiri Bernasek);

---

Subject: 9.1) How can I work with .arc files on my 8-bit Atari?

ARC.EXE for MS-DOS was released by System Enhancement Associates (SEA) around 1985. It will compress and store groups of files as one file, making it easier and quicker to download programs and support files at once. Because of the ease of use and availability of this program, it quickly became the defacto standard for file archives on Intel-based IBM machines. Files compressed and stored with ARC or a compatible utility are normally given the filename extender ".arc".

The 8-bit Atari computers have several software utility options that are fully compatible with ARC.EXE, the most important being:

Super UnArc 2.4 and Super Arc 2.4 - shareware by Bob Puff, released 01/31/89
Available:
http://www.nleaudio.com/css/files/superarc.arc (complete package + docs)

Also, SpartaDOS X includes a fully compatible ARC command for both creating and extracting .arc files.

---

Subject: 9.2) What file formats for entire disks/tapes/cartridges are there?

It is now common, especially when working on Windows PCs or Macs, to work with Atari software as files or "images" containing the data from an entire disk, data cassette, or cartridge as duplicated from the native media for the Atari.

Here is a list of file formats, arranged by their associated filename extensions. These are all filename extensions used to name files containing entire 8-bit Atari floppy disk images, cassette tape images, or cartridge images.

.DCM -Image format invented by Bob Puff, for his Disk Communicator 3.2
utility.
Used when working with native Atari hardware.
DISKCOMM is at http://www.nleaudio.com/css/files/DISKCOM.ARC
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

.ATR -Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer platforms. SIO2PC is at http://www.tcainternet.com/wa5bdu/

.XFD -Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.
Xformer is at http://www.emulators.com/

.PRO -Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.
APE and APE ProSystem are at http://www.atarimax.com/

.SCP -SpartaDOS SCOPY image file. SCOPY was a utility by ICD.

.DI -Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

.CAS -Cassette image format invented by Ernest R. Schreurs, for his
Digital Cassette Image system (includes CAS2SIO, WAV2CAS, and CAS2WAV
MS-DOS utilities. See: http://home.planet.nl/~ernest/

See also:
Atari Disk Image FAQ (Steve Tucker)
http://www.atarimax.com/ape/docs/DiskImageFAQ/

One tool for converting among all of these disk image formats is:
Acvt v1.07 by Jindrich Kubec, found at http://jindroush.atari.org

---

Subject: 9.3) How can I copy my copy-protected Atari software?

Russ Gilbert writes:

Almost all commercial software for the A8 is/was copy
protected. For boot disks, this usually involved a large
number of special formatting that couldn't be copied using
ordinary sector copiers. Usually the boot process involved
checking to see if a certain sector error occurred, then
proceeding. If the error did not occur, the disk was a copy
and would not work.

For carts, usually the method of protection was to write to
the cart area of memory and see if the value changed. If the
value changed, the cart program was in RAM, not ROM and
would fail to operate.

For tapes, again a fair number of schemes were used. Some
varied the speed at which the tape loaded. I'm not familiar
with tape protection schemes.

With all software media (cart, tape, disk), there may be
program encryption, which must be decrypted before the
program can run. This to make more difficult disassembly of
the program.

There were/are a number of products to defeat copy
protection/allow copying of protected software for the A8.
The most common way to defeat copy protection was to

disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE ProSystem, by Steven Tucker, in the registered

version of this shareware allows making disk images called
'Pro' images. APE (Atari Peripheral Emulator) requires a
cable, called the SIO2PC cable, that connects the A8 13 pin
serial port to a serial port on the IBM PC clone. To make
'Pro' images, a special adapter cable is needed, not just
the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

------------------------------

Subject: 10.1) What programs can log in to other computers via modem?

Here are some of the more popular PD/freeware/shareware terminal emulator and
related programs available. Use one of these programs for accessing a dial-up
Bulletin Board System (BBS) with your Atari, or for accessing a dial-up "shell
account" with your Internet Service Provider (ISP). Dial-up shell accounts
are no longer widely available here in the 21st century! (There is no
general-purpose PPP capability for the 8-bit Atari that I am aware of.)

ATAR-Z-MODEM 1.2, 5/29/94, shareware by Larry Black
Emulates: n/a
Text: 40 columns in gr.0
File Xfer: ZMODEM download
Autodial: No
Backscroll buffer: No
Capture-to-disk: no
Summary: Intended to be used as an external ZMODEM receive utility in
conjunction with other terminal programs, especially BobTerm
http://www.umich.edu/~archive/atari/8bit/Telecomm/Protocols/atzmod12.arc

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 release that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
Available: http://www.nleaudio.com/css/ (version 1.21)
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/BOBTM122.ARC (com only)
http://people.a2000.nl/becotel/archive/bobt123.arc (1.23)

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None

Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/FLICK051.ARC

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
Available: http://www.cs.huji.ac.il/~itayc/

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: k65v37.arc ; k65doc.arc - docs ; k65src.arc - source

OmniCom by CDY Consulting (David Young)
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit
filename: omnicom.arc

PabQwk 2.0, 1 Feb 1994, shareware by Low-Budget Productions (Pab Sungenis)
Requires: 128K XL/XE
Emulates: n/a
File Xfer: QWK upload/download
Summary: The Professional QWK reader for the Atari 8-bits. (QWK is a
packet format created in the IBM BBS community for reading mail
offline.)
http://people.a2000.nl/becotel/archive/pabqwk20.arc

Term80 1.6 (8.25.95), by CTH Enterprises (Tom Hunt)
Requires: MIO or Black Box
Emulates: ANSI
Text: 80 columns in gr.8
File Xfer: XMODEM receive, YMODEM send/receive
Autodial: Yes

Brackscroll buffer: No
Capture-to-disk: Yes
Summary: Designed for calling IBM ANSI BBSs at the highest possible
speeds supported by the MIO and Black Box (14.4 Kbps)
Available: http://cth.dtdns.net/Featured/term80/term80.html

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: vt850b1.arc

---

Subject: 10.2) What programs can I use to host a BBS on the Atari?

The 8-bit Atari was particularly popular for hosting a dial-up Bulletin Board System (BBS). Uploading/downloading files, online messaging, even online gaming services can all be hosted on an 8-bit Atari operated as a dial-up BBS.

This section attempts to list all BBS programs for the Atari. Of these, BBS Express! Professional and Carina BBS seem to be programs that stand up well even today.

Contributors to this section include: Winston Smith, Steven Sturza, Chad Hendrickson, Don Fanning, Matt Singer, Pete Davis, Jeff Williams

o AMIS BBS -- The Atari Message Information Service, public domain.
The "granddaddy" of BBS programs for the 8-bit Atari.

The AMIS BBS was written in BASIC by people from the Michigan Atari Computer Enthusiasts. It included designs for a ring-detector. You needed a sector editor and had to allocate message space by hand, hex byte by hex byte.

Several versions of AMIS:
* Standard AMIS
* MACE AMIS - from the Michigan Atari Computer Enthusiasts
* Fast AMIS
* MPP AMIS by Matt Pritchard
* TODAMIS 1.0, for 1030/XM301, 1986, Trent Dudley

o ATABBS -- Rod Roark writes (3/12/03):
This is really straining my memory -- don't recall exactly when I wrote the thing (maybe '80 or '81), but as far as I know ATABBS was the world's first BBS for the Atari 400/800.

I ran it out of my condo in Atlanta on a 48K 400 with an 80K floppy drive and a 300 bps Hayes Smartmodem. The 48K memory module was a third party add-on, not Atari's.

It was written in Atari BASIC with a few bytes of machine
language thrown in.

o ATKeep -- An Atari 8-bit version of CITADEL BBS, by Brent Barrett
ATKeep is a Citadel-like BBS system for eight-bit Ataris. ATKeep runs under SpartaDOS and requires BASIC XE and 128K of RAM. Originally "MBBBS (Message Base Bulletin Board System) 1.0, March 24th, 1986" MBBBS was changed to Atari Keep, or, ATKeep for short, around version the time version 4.0 was released (June 15, 1986).

ATKeep 7.0 finally took the aide and cosysop commands out of a menu section and put them into extended commands, where they belonged. It also added a SYSOP level command set. Users were no longer "users" "aides" or "cosysops," they had become level "A" (SYSOP) through level "Z" (READ ONLY). The system had become extremely complex. Public, hidden OR password protected PRIVATE rooms. Each room now had its own access level (thus keeping people of lower level from getting in EVEN if they knew the room name). Each room was assigned a RWRT (or Read WRiTe status), which determined who could enter messages in it, and whether or not public or private messages, or both were to be allowed.

Before version 7.0, ATKeep only worked with the Atari 1030 or XM301 modems. ATKeep 7.0 was rewritten to accomodate the 850 or PRC interface allowing use of any Hayes compatible modem.

ATKeep version 7.50 was released (1987), was version 8 released?

o BBCS -- Bulletin Board Construction Set, by Scott Brause/Antic, 1985
A machine language program, developed as the Jersey Atari Computer Group (JACG) BBS system.

BBCS was known for it's great flexibility. The sysop was offered easy customization by the use of menus. Many BBSes before it required that you had to actually change the BASIC code in order to customize your BBS.

Unfortunately, it also suffered from a reputation for stability problems.

o BBS Express! -- 1986, Leith Ledbetter/Orion Micro Systems
Written in compiled Action!. 1030/XM301 and 850 versions.

o BBS Express! Professional ("PRO") --
Originally by Keith Ledbetter/Orion Micro Systems, now still a commercial product of Video 61, http://www.atarisales.com
See also http://cth.dtdns.net/pro/pro1.html

Written in 100% machine language.

Requires XL/XE, SpartaDOS 3.2+, hard drive highly recommended, or at least a large ramdisk. R-Time 8 is fully supported.

o Carina BBS -- a shareware product of Shadow Software/David Hunt.
Carina II was originally developed by Jerry Horanoff/CARINA Software Systems

Requires an XL or XE computer, at least 500K of storage capacity (including ramdisk and drives), and SpartaDOS version 2.3 or greater.

Recommended: 192K ramdisk or greater, and an R-Time cartridge.
Fully supported: An MIO interface and a hard drive.

Pete Davis writes (15 Aug 2002):
Carina was a pretty powerful BBS system. Though it was written in BASIC (with a number of machine language routines), it was expandable and had was able to load new BASIC programs with the BBS running. In fact, it was quite modular and would load different sections of the BBS at runtime. I actually used it when I ran a BBS some time back.

Carina 2.6 is available at:
http://www.umich.edu/~archive/atari/8bit/Telecomm/Bbs/carbbs26.arc

Carina is also at:
http://www.aracnet.com/~atari/ftp/car_bbs.arc (download doesn't work for me)

o Carnival BBS -- essentially AMIS with an overlay to allow for private messages and passwords.

o FoReM BBS -- Friends of Rickey Moose BBS. By Matt Singer.
At the time, there were a lot of BBSs around called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I think that this is the great-grandparent of the FOREM-XE BBSs that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o FoReM XL BBS -- by Matt Singer.
FoReM BBS updated to take advantage of BASIC XL from OSS.

o FoReM XE BBS -- by Matt Singer
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes).

o FoReM XE Professional BBS / FoReM XEP BBS -- by Len Spencer
A re-write of FoReM XE BBS, last version was 5.4, Jan 5 1993.
FXEP requires an XL/XE computer with at least 128k of memory, the BASIC XE cartridge from OSS/ICD, SpartaDOS 3.2 (this program will NOT work with any other version), and at least 500K of storage.

FXEP is in the public domain, http://members.aol.com/lenspencer/

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area.

"1983: Nite-Lite B.B.S. goes on the air. (Was it running A.M.I.S. ?) It is called "Nite-Lite" because the computer monitor casts an eerie glow about the

room. 1984: Paul Swanson writes his own BBS hosting software for the ATARI 6502 8-bit computer. He names it "Nite-Lite". The Nite-Lite BBS hosting software goes on to be the most successful commercial BBS software ever written for the ATARI 6502 8-bit computer. 1989: Nite-Lite BBS puts in a second line. (MichTron boards eventually take the place of all of the ATARI Nite-Lite boards.)" - Winston Smith

This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSs that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o OASIS (the commercial version) / OASIS Jr. (the pd version)
Originally by Ralph Walden, then Leo Newman took it over, followed by Glenda Stocks/Z INNOVATORS, then Alf (Jeff Williams).

All machine language. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". An excellent message system, and a complex file system. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). OASIS IV performs networking.

Glenda Stocks writes at http://world.std.com/~snet/glenda.htm :
I purchased the source code rights to OASIS and began marketing the BBS software to Atari 8-bit enthusiasts around the world. I felt that I had the superior BBS software because I had programmed in the ability to run external programs, including online games and user surveys. I also had added color prompts for IBM clone users who called Atari boards running my OASIS software. Sometime in 1991...I sold the rights to OASIS to a man in Canada..

Jeff Williams ("Alf") writes: (12/6/02)
OASIS was around prior to either PRO or BBS Express IIRC. I don't know when exactly it showed up, version 3.09 was the first one I remember seeing. What made it nifty was it was very fast, being all assembler, and having some different features that things like Forem & Carina didn't have. Compared to something like Forem MPP at the time, it was kind of amazing.

Ralph Walden sold it to Glenda Stocks, who chopped it up into modules and sold it as ver 4.7. PRO was out by then, and was a much more complete offering imo.
Glenda wrote some modules for 4.7, but it never really went anywhere because the architecture was so cramped with her changes.

Eventually she gave up and sold me the source. I looked it over and realized it was a mess and nothing was going to happen with it. I worked on a version 5 for a while, but never made much progress.

o SMART BBS -- by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

---

Subject: 10.3) How can I read/write 8-bit Atari disks on an MS-DOS PC?

There are several programs that allow an MS-DOS system to work with an Atari-format 5.25" diskette. Each of these work with the Atari SS/DD 180K format, so you'll need an Atari DOS and disk drive capable of this format.

#1 Choice:
AtariDsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

#2 Choice:
MyUTIL by Mark K Vallevand. Based on Charles Marslett's UTIL.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/myutil.zip
Includes SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Other similar utilities:
ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
www.umich.edu/~archive/atari/8bit/Unverified/Diskutils-redist/atario21.arc
SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/sr.arc
UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks.
http://www.wordmark.org/

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width.
The following is generally true in the PC world:

- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of thumb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above mentioned utilities work with SS/DD 180K Atari-format disks or
SS/DD 180K SpartaDOS disks, the following combination of utilities has been
used successfully to read SS/SD 90K Atari-format disks. So if you only have
standard Atari 810 and/or Atari 1050 drives, you could look into:

AnaDisk -- now a product of New Technoligies Inc. (NTI)
See: http://www.forensics-intl.com/anadisk.html
The current version is "not made available to the general public" (!)
Previously a product of Chuck Guzis @ Sydex, http://www.sydex.com/
Older versions available: http://ch.twi.tudelft.nl/~sidney/atari/
- Reads/Writes "any" 5.25" diskette

DeAna by Nate Monson
Available: http://ch.twi.tudelft.nl/~sidney/atari/
- converts AnaDisk dump files from Atari format

See http://ch.twi.tudelft.nl/~sidney/atari/ for tips on using this
combination of utilities.

Preston Crow writes:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.

For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

---

Subject: 10.4) How can I read/write MS-DOS PC disks on my Atari?

Several 3rd-party hardware upgrades add the capability of working with
MS-DOS diskettes to your Atari system:

Happy 1050 upgrade for the Atari 1050
-- read/write 180K 5.25" MS-DOS floppies

CSS XF Single Drive Upgrade for the Atari XF551
-- replace the 5.25" mechanism with a 3.5" mech.
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm

CSS XF Dual Drive Upgrade for the Atari XF551
-- add 3.5" drive without losing the 5.25" drive
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm

CSS Floppy Board, for the CSS Black Box
-- adds support for PC 720K and 1.44MB 3.5" drives to your Atari system
-- adds support for PC 1.2MB and 360K 5.25" drives to your Atari system
-- read/write 5.25" and 3.5" MS-DOS disks in your PC drives with your Atari
see: http://www.nleaudio.com/css/products/floppy.htm

---

Subject: 10.5) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two computers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go
to the left 1 to 13 then #14 is under #1 and left again
so that #25 is under #13.

Most term programs allow a null connection, without a
carrier detect. Notably, '850 Express!' does not. I have
only used 'Procomm 2.4.3' (the last shareware version of
Procomm) on the PC and BobTerm on the Atari, but other

term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from BobTerm, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called ATAR-Z-MODEM by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: Connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin

connectors of the two modem cables you might already
have connected to your Atari and PC or Mac. You may need
a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here:
(Figure out or look for pin numbers on the ports.) Note
that these are pin assignments, and NOT null modem
connections with the XMT, RCV crossed and GND straight
thru.

Atari 8-bit PC AT 25 PC AT 9 pin
------------------------------------
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

------------------------------

Subject: 10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?

SIO2PC
======
From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:
- Emulates 1 to 4 Atari disk drives
- Store your Atari files on PC hard or floppy drives

- Boot from the PC, real drive not needed to start-up
- No software or drivers required for the Atari;
no conflicts: use your favorite DOS
- Twice as fast as an Atari 810 drive and more reliable
- Co-exists with real drives in the Atari daisy chain
- Compatible down to the hardware level: use sector copiers, etc.
- Print-Thru captures Atari print-out and routes to PC's printer
- Convert Atari files to PC files and vice versa
- 1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.wolfpup.net/atari/atari.html

Atari810
========
Atari810 1.4d, by Dan Vernon, is a disk drive emulator in the tradition of
SIO2PC, for the Windows NT/2000/XP platform
http://retrobits.net/

---

Subject: 10.7) How can my Atari use my PC's HD, printer and modem using APE?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software.
The Atari Peripheral Emulator (APE for short):

- lets your PC act as high-speed drives.
- It lets you print to your PC printer.
- And it lets you use your PC modem on the 8-bit."

http://www.atarimax.com/

---

Subject: 10.8) How can I connect my 1050 to my PC with the APE ProSystem?

The APE ProSystem goes beyond APE. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected
disk images which are then used by APE.

- The ProSystem hardware is a cable designed to allow direct connection
of a stock 1050 disk drive directly to a PC's serial port for use by the
PROSYS.EXE software.

http://www.atarimax.com/

---

Subject: 10.9) What about interoperating with the Apple Macintosh?

Mark L. Simonson keeps a nice set of web pages which he calls "Mac/Atari Fusion: Atari 8-bit Resources for Mac Users." Please visit:

http://www2.bitstream.net/~marksim/atarimac/

---

Subject: 10.10) Are there 8-bit Atari tools for the Commodore Amiga?

'551conv', freeware by Achim Hartel:
Converts a real Atari-800-disk, .xfd-image or .atr-image into a real Atari-800-disk, .xfd-image, .atr-image or extracts the files of the disk (-image). All 4 formats of the XF551-station supported: Single, Medium, Double, Quad. Version 1.03.

---

Subject: 11.1) How did Atari get its name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name
---

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong.

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations,

but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

---

Subject: 11.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving
birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

1979
Atari files with the USPTO for a patent for a "Data processing system with programmable graphics generator" (the 400/800 computer system) on January 8, 1979. Inventors listed:
Mayer, Steven T. (Auburn, CA);
Miner, Jay G. (Sunnyvale, CA);
Neubauer, Douglas G. (Santa Clara, CA);
Decuir, Joseph C. (Mountain View, CA)

The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
From Atari Connection magazine:
"At the National Computer Conference in Chicago on May 5, 1981 Atari announced that the 8K Atari 400 was being discontinued and that the price on the 16K version was being reduced to $399."

The USPTO grants U.S. Patent 4,296,476 to Atari on October 20, 1981 for the 400/800 computer system. Read the full text of the patent here:
http://makeashorterlink.com/?M2561456

November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Warner Communications sells the Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Warner initially retains the arcade division of the former Atari Inc., and renames it Atari Games Corporation. Soon thereafter, Atari Games is a private, independent entity, though Warner remains a major investor.

Atari Games inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market.

1987
Atari Games creates the Tengen label for the purpose of marketing games for home game systems (potentially competing directly with Atari Corp.)

1993
Atari Games is purchased by Time Warner.

1994
Time Warner consolidates Atari Games into Time Warner Interactive. Use of both the Atari Games and the Tengen brands are discontinued.

1996
On March 29, 1996 WMS Industries (Williams, Bally and Midway) completes its purchase of Time Warner Interactive. Upon the sale, Time Warner Interactive adopts the Atari Games name and logo, and Atari Games is made a division of Midway Games.

1998
In April of 1998 WMS spins off to shareholders its entire stake of Midway Games, making Midway Games essentially an independent entity. Atari Games remains a division of Midway Games.

1999
Atari Games releases San Francisco Rush 2049. This turns out to be the last coin-operated arcade game sporting the Atari Games name and logo.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms. The Midway Games West division lives on, developing games for home systems for Midway Games.

February 7, 2003: Midway Games shuts down their Midway Games West division.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

According to Atari Explorer magazine, the 130XE was engineered by Jose Valdes.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (US) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, in a "reverse merger," Atari Corp. purchased JTS, with the new parent company taking the JTS name while Atari was immediately designated a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which was a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro Interactive's games, including several re-makes of classic Atari titles, were marketed under the Atari Interactive name and logo. Atari Interactive was termed "a Hasbro Affiliate."

Games produced by "Atari" under Hasbro ownership included:
Atari Arcade Hits 1 & 2, Breakout, Centipede, Missile Command,
Nerf ArenaBlast, Pong, Q*Bert, The Next Tetris, Atari Greatest Hits

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro, renaming the subsidiary "Infogrames Interactive." The purchase included the Atari titles and intellectual properties (known at Hasbro as "Atari Interactive").

Between 2001 and 2003 Infogrames placed the Atari brand on some of its "premiere" gaming titles.

2003
Beginning May 7, 2003 Infogrames Entertainment adopts the ATARI brand and registered trademark for all operations, effectively changing the name of the entire company to ATARI.

Additionally, the Company's wholly owned subsidiary, Infogrames Interactive, Inc., which develops many of the game derived from the Hasbro line of board games, changes its name to Atari Interactive, Inc.

TODAY
New York-based Atari, Inc. develops interactive games for all platforms and is

one of the largest third-party publishers of interactive entertainment software in the U.S. The Company's 1,000+ titles include hard-core, genre-defining games such as Driver, Enter the Matrix, Neverwinter Nights, Stuntman, Test Drive, Unreal Tournament 2003, and Unreal Championship; and mass-market and children's games such as Backyard Sports, Nickelodeon's Blue's Clues and Dora the Explorer, Civilization, Dragon Ball Z and RollerCoaster Tycoon. Atari, Inc. is a majority-owned subsidiary of France-based Infogrames Entertainment SA, the largest interactive games publisher in Europe. For more information, visit www.atari.com.

Infogrames Entertainment SA (Euronext: 5257) is the parent company of Atari, Inc., its U.S. subsidiary, and Atari Europe, its European subsidiary. Infogrames Entertainment SA owns 89% of Atari, Inc., which is publicly traded (Nasdaq: ATAR). Infogrames Entertainment SA owns 100% of privately-held Atari Europe. http://corporate.infogrames.com/

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

# 5956. Really Great A8 Video Display

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-09 02:31:34 UTC
From: llppwhite@aol.comnsp
Message-ID: <20031108213134.06042.00000385@mb-m02.aol.com>
Source record: 18469

Thought I would share my experiences of my never-ending quest for the "perfect display" from my "Super Video" mod. 130XE. And this is pretty simple -- I have used a variety of video cables, torroids, resistors, etc. trying to ger rid of all vestiges of RFI and other gremlins that add ghosting or "pulsing" (hard to describe) to the video display. I hooked up my system with a brand-new video cable purchased from Universal Radio. This is the type that was sold for Atari and C64's. I don't know when they were manufactured, but they are still very flexible, so I suspect they are relatively recent.

Someone posted a link to Universal a couple of years ago. Since I use S-Video to a VGA convertor, I had to make an RCA to S-Video adapter which is about 6 inches long for the Chroma and Lum. lines. Nothing else changed, and now I *think* I have the perfect display. The display letters are clear and crisp, and there are no distortions of any type visible on the screen. The vertical lines on the screen are gone. And if nothing else, it's probably good to re-post the link to Universal.

Universal Radio (very competitive prices):
http://www.universal-radio.com/catalog/parts/dincable.html

Jameco Electronics now carries quite an assortment of video cables, adapters, etc.at:
http://www.jameco.com

Which video mod did you do on yours? I have a spare 130 that I am thinking
of trying one mod on.

I know the best display I have seen is when I hook up my 130 to my Commodore
1902 monitor w/ Chroma and Luma. It looks amazing.

Hi Tim-

I did the Super Video for the 130XE from Atari Classics now posted at
http://www.geocities.com/atarimods/sv130-1.html

I never had a 1902 -- I had a couple of 1802's and their display was very, very
good. It is a little difficult to compare, but when using a VGA display, you
don't see the "dots" as seen on composite-type displays.

Yawn!!!!

TROLL TROLL TROLL TROLL TROLL TROLL

notice how the loser starts crospossting to try to get everyone hating each other all over again. The LOSER posting this garbage is no doubt a usenet punk who while not out trolling spends all his time beating people over the head about top posting and quoting RFC's to win arguements. Would be a pity for the loser of some cracker got hold of their real email address and ip address and posted it for all to view, not that I'm telling anyone to do that!! I've seen it happen trolls before, wasn't pretty either.

I gotta few a couple years ago at a garage sale. By a few I mean 2 big cardboard boxes of them for $10. It'll take me ages to go through all that. Makes me remember back in the 80's when they were expensive (especially maxell) and I could never have enough. These days I'm lucky at least I can pop down to active surpus downtown (toronto for you out of towners) and get some new old stock on fuji disks.

I've got this game, I mail ordered from antic publishing back in 90 or 91 when they had their big sale, just before they closed. Unfortunately I never finished the game and havent played it in a few years. I remember there was one spot, in a desert I think, where I had to get by a snake and could never do it without getting killed.

It reminds me of another similar game I saw on the commodor 64 years ago called "Asteroid" or somethin. It was a science fiction thing where one played an astronaught who had to get ready for and go on a space mission to plant explosives on an asteroid to prevent it from smasing into earth. If any of the mail order dealers around had that one for the Atari 8bits I'd definately have a money order in the mail to them straight away.

Reminds me of one of my early unfinished projects. I seeing some program in basic where the text scrolled outwards from the middle of the screen to the sides and finished up centered. I went on to trying other things before I fiigured how it was done. I could make it scroll left or right but didnt get it going both ways at the same time.

This reminds me of a similar brouhahaa back in '87 when Darek Mihocka created
his first apple II emulator to the computes ST magazine. They rejected it
since it ran far slowly than the original, was very buggy, but their main
reason it contained copyrighted rom code from apple. Not long after he

submitted the atari 8bit version which later became xformer, and it was rejected for the same reasons. The easy way around that is simply copy the roms from your own machine, but then if someones running an emulator cause they dont have the original machine anymore?

I think I posted this link back in 99 or 2000. I actually made my own
cable from a MIDI cable and an S-video cable. I did the super-video
mod to one of my 130XEs, and it looks great! However, on a 36" TV
with S-video input, you can see the breaks between color clocks, since
the picture is not blurred. Text is great.

Come to think of it, I no longer have a "stock" 130XE. One has
super-video, one has MyIDE and one has the 130XE/800OS/OmniMon OS
switch.

I have more disks around than I could use in a lifetime (new and "pristine" used), but FWIW, here's another point of view.

I was getting ready to go through 500 or so of them and make sure they were still good, and even back up many of the more "important" ones. Thus creating even more disks-in-use. Then an Atari-friend asked me why I didn't just make ATR's out of them and put them on CD's using APE or Atari 810. The more I thought about it, the better that sounded. Shelf life of a CD -- maybe 50 years. (?) Time to back up a CD -- about 15 minutes. Space required by a CD versus 5-1/4" floppies -- 1/700th (give or take, and a lot less if you ZIP or RAR a folder of ATR's.)

Don't get me wrong -- the need for some floppies will not go away, but I now have my collection in two boxes instead of a half-dozen, keeping only the things that I use frequently and copy-protected stuff on real disks. The whole deal is a lot more managable, and IMO, more secure. Actually I know it's more secure -- I have several backup CD's in a separate location.

Larry

Well, an interesting topic only because I used to be in the
Atari/Commodore flame wars back on the BBS's in 1983! :)

When I came back in 1999, I wanted to have fun with that again, but found
that those that were left on vintage platforms were not business people but
hobbyists like me. So I teamed up with them instead. Besides, I, like the
world, find Microsoft a much bigger target.

I appreciate any solution that is non-mainstream.

Currently I type this message on the Amiga, the true successor to the
Atari 800. Amazing what I discovered once I opened my mind a little.

They were both part of the HiRes Adventures/SierraVentures series.
The Atari got: #0: Mission Asteroid, #2: Wizard and the Princess,
#3: Cranston Manor, #4: Ulysses and the Golden Fleece and #6: The
Dark Crystal.

Other platforms: #1: Mystery House and #5: Time Zone ($100 in 1982!)

Apple ][ Emu on the ST? Aside from Spectre, and then running "][ in a
Mac"? :) Would have liked to play with that.

Liked X-Former. Played with that for a while.

Hmmmm... as for current emulation...

Take your machine... copy the rom, and then store your current machine.
That is the philosophy of the current Emu scene. I agree with that.

You see, this is the way I look at emulation, MP3's, movies and everything
else. This may not be totally right, but in the end, people win all together.

Take something. Borrow it. Copy it even.

If you REALLY like something that you will use all the time, in time the
opportunity will arise where you will get a official copy. If you don't, you
will eventually care less about the item, and in time it will get weeded out of
the collection. It is just that simple, and that is what happens with me.

MP3's these days are created from my own CD's for my own use. (Actually I
use AAC's at the moment.) Those that I get from other sources I listen to
them, gain the name recognition, and later I say "Hey! I know them." And buy
the CD.

Emulation, much the same. I take the rom. Take an Atari Jaguar title for
example of a game I have yet to get... attack of the Mutant Penguins. I run on
the emulator to see what it is like, and to see if I want to hunt down a copy.

MP3's, emulators, online movies and clips... they all do the same thing for
me... introduce me to great products out there that I didn't otherwise know
existed.

I hope one day the world catches on to this concept.

> they dont have the original machine anymore?

Not a problem for the ++ emulator: It comes with its own version of the
operating system. It should be mainly compatible to software that plays
by the rules. Unfortunately, not all software does, but that's a problem
that cannot be solved (that is: having a 1:1 original ROM file without
owning the ROMs).

So long,
Thomas

I'm not familiar with the Atari versions, but for the Commodore 64, Airwolf and Blue Thunder existed as separate games. It wasn't just the same game with a different name.

Er well,
ABBUC requires approx 5000 diskettes per year. Do you have any e-mail
adress of this supplier, so we can ask him if he ships to Germany ?!?
greetings from ABBUC, Andreas Magenheimer.

Well just FYI I removed all 16 ram chips and installed sockets and put in new 4164's and it works fine. I also removed the basic rom and installed a socket, cleaned the chip, and it works fine as well. I am waiting on a new power switch from Best and then it will be finished.

Yes, I have this game also and I too could not get by the snake
without getting killed. I heard that you have to kill the snake
using a stick or a stone that you fine somewhere in the begining
scenes.

Thanks for your answer! So it is an adventure game.

Is it text based input and output like Infocom and Scott Adams
adventures, or is it with graphic interaction?

Anders

After all these years, I've finally been hired as a game programmer
(rather than as a web developer, forced to write games only as a hobby :) )

I'll be doing games for cellphones, so my keen eye for low-resolution
graphics and ability to deal with limited CPU speed will come in handy. ;) ;)

Wish me luck!!!

(BTW, it's all thanks to my having a booth at the Vintage Comp Fest! Sweet!)

Good look !
It has been always my dream (from those years when i was 6 years old, and
programming atari basic on my 65xe) to be a game programmer.
A lot of us, end working as sysops, sysadmins, web developers, or
phone-support (dont know if you call them that).
All my best whishes , and if you can... as a hobby.... u could write an emu,
and make the games playable for us xD

:o)

I have several systems. I have an Atari800XL I just did a 256ram upgrade. I also have a XE Game System. What i've noticed is now on the 800xl I have to leave it off for 15 seconds to let the ram discharge. Is this normal or do I need to replace the capacitors? Also I have the same symptoms on the XEGS but it is stock no mods. Any ideas?

# 5992. CAS2WAV problem

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-12 08:20:19 UTC
From: peter@obermotz.com
Message-ID: <668025af.0311120020.535bc702@posting.google.com>
Source record: 18355

Hello,

I have just received an 800XL with a tape deck from a friend of mine as a gift. I would like to play some of the old classics so I downloaded a bunch of games in .CAS format and tried to convert them with CAS2WAV. Whenever I try to load (boot) them on the Atari, the process dies after about half a minute - the computer stops the motor of the tape deck and nothing happens. I tried to record the tapes at different volume levels, cleaned the heads of the tape deck but it still does not work. So I am clueless and disappointed as I really miss my dose of Donkey Kong. Maybe I do not use the correct parameters with CAS2WAV? If anyone has any ideas how to solve this lifethreatening problem of mine, please let me know :-)

Regards

Peter

o) The timing of the PAL and NTSC versions differ, it might be that the problem is due to the lack of adjustment in the timing. Unfortunately, this field is a bit problematic: Original (A800) Os'es did not care about the timing differences, making "PAL recordings" hardly reliable for "NTSC usage" and vice versa. This issue was addressed by the XL operating system, though this introduces another mild incompatibility.

o) These files are supposed to be read from tape? You cannot just take a bootable disk and write its contents 1:1 onto tape. (Just a thought)

o) Did you hold OPTION and START while booting? The basic ROM might be in the way. You need to disable it by holding option.

o) It might still be easier to try the disk images on an emulator (plus, it loads quite a lot faster...)

Greetings,
Thomas

That is normal, have to wait 15 seconds for a good re-start.
It occurs with 256k upgrades.

What about on a stock XEGS?

Hi,

thanks for the answer. The machine in question is a PAL 800XL and the
.CAS files should be tape files (I guess). I also tried to convert
XEX->CAS->WAV with no success either. Maybe someone can tell me what
values to use when running CAS2WAV or I should just buy a SIO2PC
cable. I only pressed START while booting so I will give it another
go.

Thanks

Peter

You definitely need to hold OPTION down as well. If you don't, BASIC will
not be disabled and most executables like your games won't like it. I
recommend using SIO2PC if you are going to use this alot. Tape is VERY
slow.

(xegs delay on re-boot, cold-start.)
I don't know about the xegs. It is 64k, but I guess it really depends
on the characteristics of the RAM chips, how long they hold
their values before they 'blank' to 0s.
Maybe someone else.

## 5999. Re: I am a game programmer!

Congratulations, Bill! Be sure to write some great games! Maybe you could draw inspiration from Atari 8bit games, for example Alternate Reality for cellphones. Or Star Raiders! Heck, has anyone done a Star Raiders type game for cellphones? There ya go!

Well I have two different stock 130XE's. One I need to wait 5-6 seconds
before I turn it back on or I get a blank blue screen with white cursor.
The other I can turn off and on right away and no problems.

Tim

XEGS are also known for long ram 'retention' times, my theory
is that this is due to much 'better' ram chips available than
back when these non-XEGS mother boards were put together.
Quite possible that there never were any N-MOS based 64x4
memory chips made so they all were CMOS to start with? That
means XEGS which uses two 64x4 chips instead of (8) 64x1 chips
has always had the memory retention problem. Not guessing anymore,
Mathy van Nisselroy was hell bent to find a solution for his
XEGS system and I don't remember him ever finding one. Just
a rumor or two that you could change a resistor here and there
and that would fix it - but no eureka! from him where he did
get it fixed. And 15 seconds is almost too short a time for
some of these machines with the problem, IIRC I've seen pretty
good looking data remaining after 30 seconds with power off.

I don't remember what models of what brands of phones we're targetting
(it's something like 25 phones!), but if the phone has BREW capabilities,
then probably. ;^)

Heh - Well, let's put it this way. I'm not a very good graphics designer,
and "web programmer" sounds weird.. :)

This was a really hot topic when the 256K upgrades first became popular. In order to work around the long ram retention times, several OS have "cold start" combinations built into them. For instance, the APE Warp OS, the Ultra Speed Plus OS, the Black Box, and IIRC there is a small patch for the OmniView OS that allowed adding the cold start feature.

There also was a hardware mod for the 800 that allowed the reset/cold start, but I never recall seeing one for the XL/XE series.
Larry

Interesting indeed. Well then on the flip side is there a way to supply continuous power to the DRAMS so the RAM disk could be retained even during a power off state?

Thomas

You THINK this is a virus? When was the last time you saw Microsoft send
out an update across the news groups? Microsoft may suck, but they don't
send out patches across the new groups and through email, which is the way
I have received many of these "updates".

The people that send these out are sniffling cowards, that have nothing in
their lives. They exist only to crawl out from under rocks to attack, and
then crawl back before they are seen. They are small and insignificant,
and they have no life. If you open crap like this, then you deserve
whatever you get from it.

Actually, a recent Supreme Court decision made those OLD ROMs legal to use
now. Someone posted something about it not long ago.

Hi,

> Interesting indeed. Well then on the flip side is there a way to supply
> continuous power to the DRAMS so the RAM disk could be retained even during
> a power off state?

The power supply thing is not the real problem. A high capacity elco and
two diodes would be all as far as the power supply is concerned. What you also
need to consider is to keep the control lines of the RAMs in a valid state,
(that is, \OE, \CE on high) and for dynamic RAM the Atari uses, to provide
the refresh cycles. That's typically the job of the ANTIC, but it won't work
on power down.

So long,
Thomas

I've never heard of that being done. The closest work-around would be booting or loading from an *external* ramdisk (mio, etc) or some type of add-in non-volatile memory device SRam, compact Flash, etc. There is some info posted at
www.retrobits.net
under Projects, then SRAM.
Larry

You know, the argument _can_ be turned around:
"Why should I spend so much for an Atari from a Dealer when I can get
the same system (with extras that the auctioner doesn't realize are
rare) for 1/2 or 1/3 the price?"

The _answer_ should be obvious. Customer Service. When you get
something on eBay, you are usually stuck with it. Unless it is totally
broken, when you _might_ get your money back. Maybe.
However, the truth is that in todays world, customer service is
lacking. If you want to be the customer's choice, you need to provide
_excellent_ and _consistent_ customer service. It is this reason I
believe some computer users would rather deal with eBay than dealers,
because some dealers are just rotten.

This has been really evident in the TI community, where dealers have
walked off with the $$$ without sending the product _many_ times.

Ben

Yes, my XEGS is a nightmare for rebooting. I''ve owned two and they're both swine to this extent. Might be associated with supply against load; either the smoothing capacitors are larger or the loading (fewer RAM chips etc) is lighter.

World speed record goes to my 400. It resets as fast as you can pop and slam the lid!

I just can't believe they made it out the factory door this way. It seems like a huge oversight in my opinion. I mean, I can deal with it but it sure is a pain when you want to boot up something real quick and just try some programs out and you have to wait for an eternity.

Thomas

Might we enquire as to the fortunate firm that's hired you for this task?
If not, no sweat - and congrats! Hopefully the pay's better too! <grin>

I built the Freezer to force a cold start on an XL/XE. It basically toggles the status of your "cartridge inserted" line in the hardware, which fools the OS into thinking you pulled/inserted a cartridge. The docs should be online somewhere.

>
```

That can be true. But most dealers especially for Atari stuff are real good. They are professional, have quality goods, and many are NOS. I just bought a new case and keyboard from Best Electronics for my TT. Paid a pretty penny but it was worth it. It was hassel free, I used my credit card, and it a few days it was on my doorstep. I could of saved a few bucks if I found one in "mint" condition on eBay, but why bother? I am tired of half hearted cleaned up units, or even worse all grimy and yellowed! I would of ended up paying 3/4 or more the price I already paid, as people love to overbid on there. My point on my original thread is it is outrageously annoying when someone lists an item for almost the same price I can get it from Best or MyAtari. Why would I bid on that item on eBay when I can get it from a real Dealer? Heck I don't know about you, but if I wanted a new 130XE I would rather get it from the dealer for $150.00 than $75.00 on eBay. Thats just me. I can get support if something is wrong, where on eBay it is "sold as is" Just recently a 130XE sold for $132 or so dollars, it was listed as NEW, and it was from a reputable seller, but for $18 more I could of got it from MyAtari.

# 6031. Indus GT w/RamCharger for CPM

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-15 06:19:04 UTC
From: Anonymous <Nobody>
Message-ID: <3fb5c557_6@127.0.0.1>
Source record: 18394

I have about 8 Indus GT drives I have collected over the past few years from different Ebay auctions. Don't ask me why, the drives are so cool I have just bought them from time to time as they have become available. Anyways, the point for this message is that ONE of the Indus GT's I bought has the Indus RamCharger installed to run CPM...but I have no idea which of the drives it is, externally they all look almost identical. How can I tell if a Indus Drive has a RamCharger installed? Thanks for any help.

I reckon u are American. And so u prolly only buy in america... BIG mistake.. U guys aee so affraid to buy overseas, so u miss better price and ppl in america use that to their advantage... Iwe got me a 130xe for 32 usd in Poland, 1050 drive for 2 beers in Slovenia, Falcon in realy MiNT condition for 40, Acorn archimedes for free in UK and so on... also a px7 from the states...

Maybe time to rethink strategie? :)

I would imagine it is the tape your are using. I had the same
thing happen to me when I used the taper player with my old 400. I
would just get a disk drive or else buy the Donkey Kong in
cartridge form. You could also hook the 8-bit upto a PC using a
SIO cable and APE on the PC or use the same SIO cable and hook it
upto an Atari ST using 800XLDJ. Each way loads image disks nicely
into the 800xl.

For me I would say that is normal. On my Atari clone, the
Hades060, I have to leave it off for about 1 minute (sometimes
more) in order to get the ram to discharge.

It seems you're jumping to some conclusions there but anyway, perhaps
it has to do with concern over issues like NTSC/PAL, power supplies,
etc.

There are in many cases enough differences to make for problems in
trying to mix.

Who knows.

Yes, I know this game sucks but I liked it as a kid!

Is anyone else having this problem? It works in Stella on my Apple
PowerBook G4, but not in PC Atari v2.6 in Windows XP Professional SP1.

Thank you in advance.

I've heard similar stories about atari stuff left in old retail stores
that once carried atari gear. Havent seen any like that since the late
80's though. Come to think of it, I do rmember a case in england last
year although its not strictly 8bit related. A bunch of jaguar items
(mostly cartridges I think) did turn up and was put on sale in some of the
electronics boutique stores in England.

Mission Asteroid was the one I'd been thinking of. Time zone was only for apple II as I remember, at the time the most complext computer adventure game at 12 disks. Compare that to another game Roberta Williams created a few years ago for the winblows systems, phantasmagoria, it topped off at 7 full cd-roms. And I thought Ultima IV was big!

While we're on the subject. Does Anyone know of a source for these games. Specifically
Mission Asteroid?
its one of the games I never owned on my 8bit but wanted to try. Not to mention a couple I
tried on the 2600
and wanted but never actually acquired: River Raid, Planet Patrol and Air Sea battle, I'm
sure most of us
remember those 3.

Some times , those idiots also support some of us, who live far away
from atari dealers (who overprice the overseas shipping)
Sadly, i havent been able to get a STE, TT, or a FALCON, cus they are
too expensive to buy from atari dealers ( us200 , + almost the same 200 for
shipping!)... well, i havent found any of those in ebay thou.
Well.. if some things go alright next days.. i may be living in mexico
soon.... maybe then i will be able to buy some things from atari dealers :o)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

## 6049. ** Legacy Atari XL/XE computers **

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-16 10:41:55 UTC
From: mstepansky@aol.com
Message-ID: <20031116054155.12215.00000265@mb-m25.aol.com>
Source record: 18412

Good reasons for pricey Atari computers: Legacy....collector's items

Why? Simply, law of supply/demands. The fewer Atari computers you find in ebay, then the harder for to find them.

Higher cost just to find them. Great stuff for collector's items. Collect them NOW before it goes "bye-bye". Think about it and you will be glad later.

Mike
Atari veterans (since 1983)
Toledo, OH

PS. Does 130XE computer w/ 320k or HIGHER "k" exists? I have never seen such 800 XL with 1 MB (!)

## 6050. What is the best Win32 Atari 8 bit emulator out there?

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-16 15:49:47 UTC
From: Anonymous <Nobody>
Message-ID: <3fb79c99_6@127.0.0.1>
Source record: 18413

I know there have been a number of Win32 based Atari 8 bit emulators under
active development for some time. This being said, which is considered the
"best" available today? Are there any that are still under
development/improvement or in 2003 has the Win32 community actually managed
to completely replicated the old 8 bits with nothing left to improve?
Thanks in advance for any responses.

Mint condition, when accurately portrayed, means in really good condition. Like you buy something new, and are real careful with it, and sell it later on. Be it 6 months later or 15 years later. I just bought a MINT 130XE in the box from eBay for $60. It looks like it is new. Though the box is a little worn but not bad at all. Still would like a NEW in the box 130XE to compliment my NEW XF551 drive! ;)

Hi,
I use Z26 an atari 2600 rom player. Its okay and still being upgraded occasionally. Stella's port to Windows is good also, PCAE is OK for Win95 not so good for w98,w2000, or wXP. You can get z26 here: If you are using a MAME cabinet there is a hack of z26 to allow Mame button controls > i.e. Start and Reset etc...

http://www.whimsey.com/z26/z26.html

regards,
RoyE

# 6054. Who remembers GAUNTLET? (console + PC related)

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-17 00:53:08 UTC
From: mike_norths_toupe@hotmail.com

comp.sys.ibm.pc.games.strategic,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.amiga.misc,microsoft.public.xbox

Hello, all,

In case you haven't heard the news, in the months of November and December, Midway will be releasing its "Midways Arcade Treasures" compilation for the X-Box, PS2 and (as far as we know still) the Gamecube. For those who haven't heard, this is a collection of 20 classic arcade videogames from the old days of Atari. Included on the list is the 4-player arcade classic GAUNTLET. <RANT MODE ON>: Before I go any further, let me make a direct request to Midway/TPB/Whomever it may concern: in the next compilation that gets released, please do us all a favor and give us the Gauntlet game that *should* have been released on *this* collection instead of Gauntlet: GAUNTLET II (which was, by far a superior and more challenging game to even the original). The original Gauntlet game has been translated, ported over, and emulated TO DEATH on so many different home platforms so many times that I swear I'm going to scream if I see another Gauntlet port over, that it made very little sense (IMHO) to do it AGAIN. As far as I'm concerned, a perfect port/translation of Gauntlet already exists; it's on the Sega Genesis 16-bit system: "GAUNTLET IV." Anyways, let's hope that Midway gives Gauntlet fans what they've been screaming for over a decade now: a home port of Gauntlet II that really does the game some justice (as there are many, MANY, home ports of Gauntlet already in existence). <RANT MODE OFF>

Now moving on, all this Gauntlet talk got me to thinking, "how many home ports/incarnations have there been now of Gauntlet?" I think I beat the horse to death in the above paragraph: lots and lots of ï¿½em. Being 28 years old, I remember the days of Gauntlet's video supremacy in the 80's and what follows are some thoughts on the many different home ports of both Gauntlet and it's sequels:

1) Circa 1986-87, Gauntlet was ported over to the Commodore 64, the Atari ST, IBM, and Amigaï¿½a DOS version also existed, IIRC. I never had the pleasure of playing any of these versions except the Commodore 64 one, but when I would look at the pics of the Atari ST version, it sure did look pretty darn close to the arcadeï¿½however from what I've *heard* reading old messages on the newsgroup archives re: the Atari ST version, the characters ran at the same speed, and there were no text boxes from the ï¿½DM' (or the ï¿½narrator' whose voice you'd always hear)ï¿½if anyone has played this version or any of the other ones, feel free to jump in here. The best way I could describe the C64 version was that it was "primitive but charming." Graphically simplistic but at the time, we kids were all just happy that Gauntlet had finally

"come home." All the characters ran at the same physical speed, and almost seemed to all share the same strengths/weaknesses. A year later (?), Gauntlet: The Deeper Dungeons was released for the above mentioned computer systems, adding 501 extra levels (and required the original Gauntlet to work). Again, if anyone ever got a chance to play this, I'd love to hear how good the game was.

2) In 1988 (also the year that Gauntlet II hit the arcades), Tengen released a home port of Gauntlet on the old 8-bit Nintendo system. This game was notable for a number of reasons. Firstly, it changed the basic format of Gauntlet by adding RPG/Quest elements: instead of levels that went on forever (in the original Gauntlet, the highest you can go is level 999, and once you exit room 999, you return to level 8), it narrowed the game down to 100 pre-set level/rooms. It also gave Gauntlet a storyline. Instead of being 4 adventurers who randomly fight thru the dungeons, Thor the Warrior, Thyra the Valkyrie, Merlin the Wizard, and Questor the speedy elf were now on a quest to save the land of Rendar from the Evil sorcerer Morak: they had to retrieve "the Sacred Orb" by defeating ï¿½the Guardian' in level 100 (it basically did what Gauntlet: Legends and Gauntlet: Dark Legacy would do a decade later; it was just ahead of it's time). Now, this particular version of Gauntlet seems to be universally reviled by fandom all over the internet, and to be honest I'm not quite sure whyï¿½or rather, I know why, but I think the strengths of the games far outweigh whatever faults it might have had. No, it was not *exactly* like the arcade version, but it *was* original and it *was* a *very* fun game in its own right. It also emphasized the strengths/weaknesses of the 4 characters. Any fan of Questor (as I am) would love this version because his incredible speed is the one main reason his character kicks ass over any of the other adventurers (the elf was always the fastest one, but that fact gets really pronounced in this NES version). And this version had a hell of a lot more life/character than the bland Gauntlet 2 NES port that came out a few years later. Anyhoo, has anyone ever solved Gauntlet for the NES? If so, I'd like to hear how the game ends. Do you have to face Morak's guardian (who guards the orb) and if so what is this being like in powers, abilities? Do you have to face Morak himself? Side note: Gauntlet was also ported over to the old 8-bit Sega Master System. I have never played it.

3) In 1990 (?), Gauntlet II was ported over the SMS, Gameboy, NES, and home computer systems. I've only played the NES version. This was released by a different company other than Tengen (the name eludes my memory right nowï¿½was it Mind Quest?). Hailed by many NES fans as the one "true Nintendo Gauntlet game," the sequel was quite faithful to the arcade version. Though it obviously could not measure up to the arcade version, it boasted the finest graphics and sound/digitized voice overs ever seen and heard in an 8-bit Nintendo cartridge. It really is amazing to listen to the DM's muffled voice ("Green Wizard shot the potion!")ï¿½you can almost really hear it. My criticisms of the game are so/so game control (the diagonal running/shooting

controls never feel quite right), lack of certain enemies found in the arcade version (the super-fast Thief and the Mugger), and certain game bugs (anyone else notice that the enemies tend to run AWAY from you sometimes when you attack them?). As an interesting side note: Gauntlet II for the Amiga is reputed to be the *closest* home port/translation ever of the arcade. I have never been lucky enough to play it (and would love to hear other's thoughts on the game), but it's supposed to be quite awesome, though with some glaring weaknesses (no text boxes or DM voice, same character running speed, etc.). Emulations of Gauntlet II for the Amiga are supposed to be all over the internet, I might get around to trying it one of these daysï¿½

4) Sometime in the early 90's, Gauntlet III was released on the Atari Lynx and the home computers as well. Never played this game. From what I've heard, this is actually a different game that got made over with cosmetic changes to make it a Gauntlet sequel. Supposedly a very *different* game than what most Gauntlet fans are used to (aliens??? WTF???).

5) I believe that it was about 1994 or '95 that "Gauntlet IV" was released by Tengen for the 16-bit Sega Genesis. This 4-player title boasted an all new quest adventure, a battle mode, a record mode, and the arcade mode. It is in my humble opinion and the opinion of the majority of gaming fandom (that I've seen) that the arcade mode of this 16-bit cart represents the *closest* most-faithful, pixel-perfect translation of the original Gauntlet arcade machine ever seen on a home system (console or PC). It's *almost* identical. I might even go so far as to say that it's the closest arcade port/emulation/whatever of *any* game ever done on *any* home system. Everything from the graphics, perfect game play, the DM's voice (which does get a little muffled at times), the text boxes, etc. You *will* believe you are playing the original arcade version of Gauntlet. It's just that damn good. And even in this day and age of super-powered consoles like the X-box, no version of Gauntlet before or after has come even close to matching the Genesis version. Now if only we could get a port of Gauntlet 2 that is just as good.

6) Somewhere after that time, Gauntlet: Legends and it's sequel Gauntlet: Dark Legacy were released first in the arcades, and then for the PS (G:L) and PS2 (G:DL). Different games from the original I remembered as a kid. Not better or worse, just different. And as a result, I never really got into them. And how could they ditch Questor like thatï¿½?

7) In the late 1990's Midway released "Arcade's Greatest Hits: The Atari Collection 2" for the original Sony Playstation. Like the one that's going to be released this month, this was an "anthology" of Atari arcade classics, with Gauntlet being among them. Now given the PS's obvious technological advantages over the Genesis, you'd think this latest (and now getting quite redundant) version of Gauntlet would be the best one yet, right? Wrong. Though graphically

superior, the game play doesn't measure up and the controls never feel "quite right." Something was definitely lost in the translation. Also, the individual screams and yells of the individual characters are missing. The DM's voice is also slowed down by game bugs ("Elfï¿½.nowï¿½ï¿½..hasï¿½ï¿½ï¿½..extra armor!"). All in all, a Gauntlet fan should only buy this collection if he/she doesn't already have the Sega Genesis version of Gauntlet IV.

This is yet another reason I can't understand why in this latest collection, Midway is re-releasing Gauntlet. They've *already* done it in the collection above. What we really wanted was Gauntlet II. Sigh. Maybe next time.

I know its an old topic but theres a few I remember, Videodrome with James Woods I think it was, circa 1983 had an atari 800 and a 2600 in different scenes. The most recent I rmember was "glitter" with mariah carey, which had a minor continuity glitch, showed a 1040ST in a midi setup in a recording studio, set in 1983. There was also that well known movie (I forgot the title) with Dabney Coleman and Henry Thomas, had a 5200 in a few scenes.

"Mike North's Toupe" <mike_norths_toupe@hotmail.com> wrote in message
news:7578f85e.0311161653.2b1911f1@posting.google.com...
| Hello, all,
|
| In case you haven't heard the news, in the months of November and
| December, Midway will be releasing its "Midways Arcade Treasures"
| compilation for the X-Box, PS2 and (as far as we know still) the
| Gamecube. For those who haven't heard, this is a collection of 20
| classic arcade videogames from the old days of Atari. Included on the
| list is the 4-player arcade classic GAUNTLET. <RANT MODE ON>: Before
| I go any further, let me make a direct request to Midway/TPB/Whomever
| it may concern: in the next compilation that gets released, please do
| us all a favor and give us the Gauntlet game that *should* have been
| released on *this* collection instead of Gauntlet: GAUNTLET II (which
| was, by far a superior and more challenging game to even the
| original). The original Gauntlet game has been translated, ported
| over, and emulated TO DEATH on so many different home platforms so
| many times that I swear I'm going to scream if I see another Gauntlet
| port over, that it made very little sense (IMHO) to do it AGAIN. As
| far as I'm concerned, a perfect port/translation of Gauntlet already
| exists; it's on the Sega Genesis 16-bit system: "GAUNTLET IV."
| Anyways, let's hope that Midway gives Gauntlet fans what they've been
| screaming for over a decade now: a home port of Gauntlet II that
| really does the game some justice (as there are many, MANY, home ports
| of Gauntlet already in existence). <RANT MODE OFF>
|
| Now moving on, all this Gauntlet talk got me to thinking, "how many
| home ports/incarnations have there been now of Gauntlet?" I think I
| beat the horse to death in the above paragraph: lots and lots of 'em.
| Being 28 years old, I remember the days of Gauntlet's video supremacy
| in the 80's and what follows are some thoughts on the many different
| home ports of both Gauntlet and it's sequels:
|
| 1) Circa 1986-87, Gauntlet was ported over to the Commodore 64, the
| Atari ST, IBM, and Amiga.a DOS version also existed, IIRC. I never
| had the pleasure of playing any of these versions except the Commodore
| 64 one, but when I would look at the pics of the Atari ST version, it
| sure did look pretty darn close to the arcade.however from what I've
| *heard* reading old messages on the newsgroup archives re: the Atari
| ST version, the characters ran at the same speed, and there were no
| text boxes from the 'DM' (or the 'narrator' whose voice you'd always

| hear)-if anyone has played this version or any of the other ones, feel
| free to jump in here. The best way I could describe the C64 version
| was that it was "primitive but charming." Graphically simplistic but
| at the time, we kids were all just happy that Gauntlet had finally
| "come home." All the characters ran at the same physical speed, and
| almost seemed to all share the same strengths/weaknesses. A year
| later (?), Gauntlet: The Deeper Dungeons was released for the above
| mentioned computer systems, adding 501 extra levels (and required the
| original Gauntlet to work). Again, if anyone ever got a chance to
| play this, I'd love to hear how good the game was.
|
| 2) In 1988 (also the year that Gauntlet II hit the arcades), Tengen
| released a home port of Gauntlet on the old 8-bit Nintendo system.
| This game was notable for a number of reasons. Firstly, it changed
| the basic format of Gauntlet by adding RPG/Quest elements: instead of
| levels that went on forever (in the original Gauntlet, the highest you
| can go is level 999, and once you exit room 999, you return to level
| 8), it narrowed the game down to 100 pre-set level/rooms. It also
| gave Gauntlet a storyline. Instead of being 4 adventurers who
| randomly fight thru the dungeons, Thor the Warrior, Thyra the
| Valkyrie, Merlin the Wizard, and Questor the speedy elf were now on a
| quest to save the land of Rendar from the Evil sorcerer Morak: they
| had to retrieve "the Sacred Orb" by defeating 'the Guardian' in level
| 100 (it basically did what Gauntlet: Legends and Gauntlet: Dark Legacy
| would do a decade later; it was just ahead of it's time). Now, this
| particular version of Gauntlet seems to be universally reviled by
| fandom all over the internet, and to be honest I'm not quite sure
| why.or rather, I know why, but I think the strengths of the games far
| outweigh whatever faults it might have had. No, it was not *exactly*
| like the arcade version, but it *was* original and it *was* a *very*
| fun game in its own right. It also emphasized the
| strengths/weaknesses of the 4 characters. Any fan of Questor (as I
| am) would love this version because his incredible speed is the one
| main reason his character kicks ass over any of the other adventurers
| (the elf was always the fastest one, but that fact gets really
| pronounced in this NES version). And this version had a hell of a lot
| more life/character than the bland Gauntlet 2 NES port that came out a
| few years later. Anyhoo, has anyone ever solved Gauntlet for the NES?
| If so, I'd like to hear how the game ends. Do you have to face
| Morak's guardian (who guards the orb) and if so what is this being
| like in powers, abilities? Do you have to face Morak himself? Side
| note: Gauntlet was also ported over to the old 8-bit Sega Master
| System. I have never played it.
|
| 3) In 1990 (?), Gauntlet II was ported over the SMS, Gameboy, NES,
| and home computer systems. I've only played the NES version. This
| was released by a different company other than Tengen (the name eludes
| my memory right now.was it Mind Quest?). Hailed by many NES fans as
| the one "true Nintendo Gauntlet game," the sequel was quite faithful
| to the arcade version. Though it obviously could not measure up to

| the arcade version, it boasted the finest graphics and sound/digitized
| voice overs ever seen and heard in an 8-bit Nintendo cartridge. It
| really is amazing to listen to the DM's muffled voice ("Green Wizard
| shot the potion!").you can almost really hear it. My criticisms of
| the game are so/so game control (the diagonal running/shooting
| controls never feel quite right), lack of certain enemies found in the
| arcade version (the super-fast Thief and the Mugger), and certain game
| bugs (anyone else notice that the enemies tend to run AWAY from you
| sometimes when you attack them?). As an interesting side note:
| Gauntlet II for the Amiga is reputed to be the *closest* home
| port/translation ever of the arcade. I have never been lucky enough
| to play it (and would love to hear other's thoughts on the game), but
| it's supposed to be quite awesome, though with some glaring weaknesses
| (no text boxes or DM voice, same character running speed, etc.).
| Emulations of Gauntlet II for the Amiga are supposed to be all over
| the internet, I might get around to trying it one of these days.
|

I still miss the GUI game list. Drag and drop is cool but the in game menu is
preferred. It gives information too. He-Man ROM works in this emulator.

Does z26 have a front-end GUI?

Actually, Gauntlet and G: Deeper Dungeons were also released for the
Atari 8-bit. I had the disk version, and it supported two-player
simultaneous play and had fairly good graphics for the system.

I'd actually add a #0 -- Gauntlet was based on Dandy (a.k.a Dandy
Dungeon), an Atari 8-bit game released by APX (the Atari Program
eXchange) and written by a M.I.T. student in the early 80's. It was
based on the 8-bit computer's character mode and had the concepts of the
larger-than-one-screen maze, monster generators, and treasure chests.

This page should have a front end for Z26. It is called X26, but get one of the older versions of z26 and they have a built in front end. Versions 1.5x you can find this in the archives at. the web page listed below on previous post..

Is there such Atari 8-bit emulator to play games on a color PDA device?

Mike

<Newsgroups: header trimmed>

Now I remember why I never actually managed to buy an APX prog - the price of APX programs was crazy: in 1983 it wasn't uncommon for an APX cassette with 1 prog to cost around $30 or about 20. With inflation that must surely be around $55 or about 40 by today's standards.

Gareth.

I have an Atari 8 bit emulator on my Ipaq and it works great.

I also have Atari Lynx, NES, SNES, Gamegear, Mame, and Genesis. I never have found any roms for the Lynx emulator. I have for the rest though. They all work fine on the Ipaq.
Randy

Hi

I'm currently auctioning a fairly rate Atari 1200XL on ebay. As many
of you know, this system was released before the Atari 800XL and
600XL. It was fairly unsuccessful and so was only available to buy for
3 months and in the US only. I'm based in the UK but happy to ship
anywhere in the world. For more information check out my ebay
auctions:

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=j0nstringer&include=0
&since=-1&sort=3&rows=50

Let me know if have any questions.

Thanks
John

Hi,

An US 1200XL is NOT very rare !

When you would sell an european (PAL) 1200XL that would be rare but I think
they were never build.

Well,
the same guy that wrote Dandy (ca. 1983), also programmed Dark Chambers
(also 1983) at least the Atari XE/XEGS cart says that. And you know,
Dark Chambers is another clone of Gauntlet - but since it was originally
programmed years before Gauntlet, one can also say that Gauntlet (1985)
is a clone of Dandy and Dark Chambers. Man, if Atari had released Dark
Chambers 1983 (and not 1988!), who knows if Gauntlet would ever had been
released ?!? greets, Andreas.

And if I remember correctly, didn't the arcade machine of Gauntlet use a
number of Atari 8-bit Pokey sound chips?

Besides the scrolling bird's-eye view arcade dungeon commercial game there was also a shareware Atari 8bit game called Gauntlet, in which your flying saucer would maneuver over a Defender-like landscape, taking out waves of enemies, and advancing to the next screen. It had really good graphics and also very good playability. Easily commercial quality. I wonder if the author made more than a couple hundred bucks off it... That was one of my favorites.

Dandy was written by John (aka Jack) H. Palevich, released (I believe) in 1982
for the Atari 800 (as part of the Atari Program Exchange). It was later released
and re-titled as Dandy Dungeon by Antic The C64 version was ported by Nick
Pelling (aka Orlando M Pilchard) for Electric Dreams in 1987.

Not sure if I can say, actually! :) Been telling my friends, but not
really 'announcing to the world' (e.g., website, usenet, mailing lists :) )

It's a tiny company. Two employees. If I'm lucky, I'll be #3 at some
point. Who knows!?

> If not, no sweat - and congrats! Hopefully the pay's better too! <grin>

The pay IS better. Not what I was making at $Worldcom$, but that job
was _ridiculous_. Nothing like feeling guilty about your job. >:^(

Anyway, thanks ;)

Hehe - Frankly, most of the cellphone games out there ARE not much more
than classic 8-bit-style games! :^) But that's why this kind of work is
perfect for me!

It was this, or writing (more) kids' software. :)

Considering how many children carry their own cell phone
today, you might end up writing kids' mobile software.

From: The Undead Mechanic <davidbowden@earthlink.net>
Message-ID: <TBnub.4705$sb4.344@newsread2.news.pas.earthlink.net>
Source record: 18446

I recently lost all of my disk images to a faulty hard drive.

Thankfully, all of my really important files are still on the original floppy disks so there's no real loss here...

The one thing that I did lose that I wish I hadn't was the disk image with the "Atari Wedge 2.0" assembler source from Compute's 3rd book of Atari.

Granted, I have the book and I *could* just type all of the source code in again, but I'm lazy.

If anyone here happens to have that on hand and could send it my way, I would be eternally gratefull.

See the sig for the email address I actually check, as the other one gets flooded with virus laden mail...

I remember the "other" gauntlet. I was totally addicted to this game.
It had something to do with shooting into the ground right? I can't
remember how to play it, just that I loved that game.

I recall reading somewhere that the author of Dandy sued Atari over gauntlet claiming that they copied the game on his idea.

(Having played Dandy a great deal in my younger days, I can see his point.)

I agree with the earlier posting that Gauntlet IV for the megadrive was easily the best version and I still play it regularly now.

Bringing me nicely onto a kind of cross topic question....

Does anybody know how to get into the 'secret' room full of food potions etc on gauntlet. Is this there just as a tease or can it be accessed by some devious method?

BTW, I'm not the same Gareth that posted earlier on this topic....

someone mentioned the Amiga version of gauntlet, which I remember was alright. There were two games on the amiga that were copies of gauntlet that were excellent one was called Alien Breed part II and the other was the Chaos Engine. They were both some of the best guantlet style games ever done, if any of you have an AMiga emulator and you are really into Gauntlet style games I highly recommend you give one of these a try.

Another game that was very similar to Gauntlet was for the Turbo Express (aka Pc ENgine) it was called Dungeon Explorer and was probably the best 8-bit Gauntlet style game.

## 6091. Atariwriter

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-19 20:39:20 UTC
From: iquitted@collegeclub.com
Message-ID: <bba8af7b.0311191239.3ceb9580@posting.google.com>
Source record: 18304

I've been trying to find a disk image or rom image or executable file
of Atariwriter to use on an Atari emulator. I did find an executable
on http://www.newbreedsoftware.com/xlsearch/ but when I try to run it
on any emulator, I just get a bunch of crazy flickering colors and a
buzzing noise. Has anyone else had this problem? Any ideas on where
I can get a file that works?

Thanks,

jeremy

# 6092. FS: Atari 800XL

Newsgroup: comp.sys.atari.8bit

Message-ID: <761a8bd8.0311191353.48ab3d32@posting.google.com>
Source record: 18305

I have the following I would like to sell as a bundle:

Hardware:
Atari 800XL
Atari 1050 floppy disk drive
Atari XM301 modem (blazing 300baud!)

Cartridges:
Defender
Star Raiders
Tennis

Books:
Atari Player Missile Graphics in Basic
Inside Atari Basic
Mapping the Atari

Misc:
2 Slik Stik joysticks
1 QuickShot joystick

Flight Simulator II (for Atari) by Sublogic - original box, docs,
etc...
Many 5.25 floppies containing games, utilities, applications, OS,
etc...

Everything is in almost new and working condition. I am in the
Cleveland, Ohio area but am willing to ship. I amsking $50 for
everything. Feel free to make me an offer, as no reasonable offer
will be refused.

Thanks,
Pat

## 6093. NTSC carts on PAL system?

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-19 22:54:27 UTC
From: Gareth <hotmail.com@dgareth.spm>
Message-ID: <nvSub.10629$lm1.76295@wards.force9.net>
Source record: 18306

Probably a silly question but is there any way of using NTSC carts on a PAL 800XL - preferably with minor hardware (or software?) modifications?

Gareth.

## 6094. From ATR to single files

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-19 23:38:51 UTC
From: AnToNio <BedenkEensWatLeuks@NotSoHotMail.com>
Message-ID: <BedenkEensWatLeuks-8E4084.00385020112003@news.fu-berlin.de>
Source record: 18307

I have several disks that (when booted) display a menu with all the
games on them, subesequently one selects the game and then it is started.

I would like to extract each game to a seperate (exe or bin) file. Since
that makes it much easier in an emulator environment to select the game
one wants to play.

Does anyone know of a programm (running on either Atari, PC or Mac) that
is able to extract the games more or less automatic?

Both worthy variants. As far as faithfulness to the original goes,
"Garrison" by then-newcomer Rainbow Arts (who later did Turrican etc.)
would be worthy of mention also; it was surprisingly technically-
competent for the time ('87-ish?)... ran much smoother than the official
port, yet somehow lacked the sheer drive of the arcade original.

## 6101. S-video in an XE?

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-20 04:47:46 UTC
From: The Undead Mechanic <davidbowden@earthlink.net>
Message-ID: <SHXub.6662$sb4.5218@newsread2.news.pas.earthlink.net>
Source record: 18314

Ok... I've been meaning to do a video upgrade/modification/bug fix/whatever you want to call it to my 130XE for quite some time. Well, I've finally decided to actually do it.

After 16 years or so of crappy video that I get from my 8-bit wonder, I want a "proper" video circuit so I can clean up the trash and make my colors somewhat more normal. The way I was thinking of going was with this bit of work.

http://www.geocities.com/atarimods/sv130-1.html

I'd be perfectly happy with that if that's all I can do, BUT... I was mainly wondering if there was an S-video upgrade/mod that I can make to it, too. I know there is one for the 2600, and, IIRC, it's a "piggy-back" design that you have to pull the TIA out of the M/B, plug the board into the TIA's slot, and the plug the TIA into the new board. It's fairly simple and straightforward to do.

So, has someone out there actually done something like this to an XE and documented it?

Thanks,
David Bowden

No special mod needed. S-Video is nothing more than separate Chroma and
Luma signals, the XE already has this on the video jack. All you need to
do is hack up an S-Video cable.

ATR extraction programs don't handle a number of the menu disk formats, you might have problems.

Here's how I do it just using the Atari;

For multiboot disks use the menu option Create A Bootable Disk. For others I transfer the files to multiboot format and then create a disk from them.

There is a utility on the Atari that lets you take menu programs and copy them to other menu disks, and another that lets you crack binary files into single load files that go onto menu disks. The latter is called binary buster and I can't remember what the first one is. If you're interested I'll have a dig around...

Hi,

> Probably a silly question but is there any way of using NTSC carts on a PAL
> 800XL - preferably with minor hardware (or software?) modifications?

Probably the easiest way of doing this would be to run it in an emulator, but
if you want to hack up the hardware:

There's unfortunately a bit more to do, and hacking the software to support
PAL correctly (if it doesn't so by itself, quite a number of games do) might
be easier, you also need to have a NTSC GTIA and a modified oscillator
circuit. On NTSC, the color clock and the system clock are generated by the
same oscillator that feeds both, the CPU and the GTIA. On PAL, things are a
bit different. The color clock is 5/4th of the system clock, and this
additional frequency is generated by first dividing the main frequency by
four with two flip-flops (two cascaced 7474 chips) and using this to synchronize
it on an oscillator of 5/4th the base frequency, which again is used to
feed the color clock line of GTIA. (This is also one reason why there is no
simple color artefacting on PAL. You would need to generate a pattern that
is 5/4th of the color clock.) To modify the 800XL to NTSC, you would thus
also:

i) Need to replace the main oscillator with that of the base frequency for
NTSC,
ii) remove the frequency divider and the 5/4th overtone oscillator, and feed
the main frequency into GTIA's color clock.

I actually never tried that modification, but it is described at the circuit
diagram for the 800XL I have. German readers find it in one of the Appendices
of "Das Atari Profibuch" by Julian Reschke and A. Wiedenhoff (sp?), published
by Sybex. Might be hard to get this book nowadays, though.

So long,
Thomas

If you find that a software solution is not satisfactory due to the double density constraint or is overwhelmed by the volume of your archive, consider APE, Atari 810, or SIO2PC. You can find more about it in the FAQ's (linked in welcome to comp.sys.atai.8bit) There is a lot of very good info in the FAQ's on this subject.

APE and Atari 810 in particular are excellent for high volume, and allows storing the disks as ATR images in many different disk sizes, densities, double-sided, etc.

Source record: 18327

Hello All,

Just a reminder that I have been able to reduce the cost of our Atari 8-bit CD-ROM compilation down to just US$9.99 including shipping to any country. This CD contains most of the contents of our original CD1 and CD2 compilations, but at less than half price! The CD contains our commercial software products (from PPP, DGS, and Rambit) in DCM and ATR format with full original manuals (scans or newly formatted) in PDF format. It also contains the 22 minute video we shot at the AMS 96 show in the UK in MPEG1 format. Full info with screen shots, free demo downloads, etc. can be found at our website. You can buy on-line using a credit/debit card (through PayPal): http://www.dgs.clara.net

Also, another reminder that we also sell Atari 8-bit to SCART or RCA cables. These vastly improve picture/sound quality by using composite rather than RF. Full info at the website (same address as above).

Wow, it's far too complex for me to try then.

I wonder why separate PAL and NTSC carts were developed. I know that the television systems are different but I don't see why this meant that the carts had to be different. Most PAL and NTSC Jaguar carts for example were the same.

What would happen if I tried to place a NTSC cart in a PAL system (assuming that it would physically fit)?

Gareth.

I would physically fit. It would also most likely work, though the
music might play to slow and the game would be overall a bit too slow.
However, this is typically not a problem. The other way round is more
problematic (i.e. PAL carts on an NTSC machine). The PAL vertical
blank is longer, and thus timing is more relaxed. Also, the display
list can grow a bit longer before the screen runs out of lines.

So long,
Thomas

Get a copy of the pin out of the video connector and a copy of the pin out
of the s-video connector. Go to radio shack, get a s-video cable and a ? 5
pin? DIN plug. and connect the like signals together. Easy.

Cool.

I did the mod just a few hours ago and when I put it back together and fired
it up, I immediately noticed a BIG difference. Had to readjust the color
potentiometer/pot/variable resistor/whatever you prefer to call it to fine

tune it out. I neglected to check this before I put the case back together, so I had to tear it apart again to get to the blasted thing.

I also ntoiced that the metal housing that the motherboard is "sandwiched" in between was loose on all sides and had been flopping around every time I moved it. I'm willing to get this was the reason I have had intermittently grainy images (even more than normal) ever since I got it. Now, I would like to ask a question about something I found while I was inside the case...

In the same column of chips that the 6502 is on, what is the very bottom chip? I didn't write down the number on it, but, the chip that is inserted into the slot has 2 legs on each side that extend past the slot and has 2 wires running off the end of it.

The computer has functioned perfectly, aside from the video problem, since the day I got it waaaaaaaaay back in the day. If you need to know what it is, I'll tear the case back open tomorrow and take a peek.

Thanks,
David Bowden

## 6128. Anyone have image of SpeedCalc?

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-21 13:01:20 UTC
From: garykato@aol.com
Message-ID: <20031121080120.02030.00000602@mb-m16.aol.com>
Source record: 18341

I'm doing some work on getting old issues of COMPUTE! magazine online for http://www.atarimagazines.com/. I'm doing the March 1986 issue that had SpeedCalc for Atari 800 in it. The OCR software I'm using can't make out much from the listing in the magazine. I could type it in, but I was wondering if anyone has a disk/file image of it. If so, email me at GaryKato@aol.com.

I have to admit it's been a blast going back to the old days using AppleWin, Atari800Win, and WinVICE. I'd never really used an Apple II (except to play Wizardry) or a C64/128 before. I have used the Atari 800 (matter of fact, mine is still setup on my dining table alongside an Amiga 1000).

Good times, good times. Thanks.

## 6129. emulators that support pc hardware?

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-21 17:25:11 UTC

I have found a program called ADIR, this runs on a PC and is able to
extract the files from an .ATR disk/file. I have managed, using this
program, to get a list of the enclosed files.

However I do not know how to extract them using this programm. Anyone
out there, who knows how to?

I would be much obliged.

Now that you have Adir you have to look for Xdir and configure to extract files into a PC directory, and which drive to read.
Try this site: http://members.home.nl/stack/atarixle.html these are older files and might not work with Windows 2000 and XP ignore any Dialogue prompts.
Roy
There are several other older PC programs that allow extractin ATR files,, atrimage11 etc..
Good Luck

That just links right back to my page since I am the author (and the link is
wrong...ooops).
In the download column there are two icons. The first looks like a windows
logo and
should download a .zip file with the exe. The second icon is SOURCE CODE
and links
to some of the source.

Hi Kevin-
This may or may not help. I ran across a Win32 program called "DOSprinter". If you Google that name, you will find a couple of links for downloading. I havn't used it, so I can't vouch for how well it does. But from its docs, it looks to be useful for our A8 purposes.
Larry

## 6139. Print Filter?

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-22 05:44:44 UTC
From: llppwhite@aol.comnsp
Message-ID: <20031122004444.28353.00000742@mb-m11.aol.com>
Source record: 18252

I recently picked up a HP DeskJet 350 portable printer on eBay. This is the last HP portable model that supports MS-Dos. It is very compact and prints 5 pages/minute (draft/B&W). I am using it with a SUPRA SIO interface. Works very well so long as it doesn't have to deal with non-printing or Atari special characters. I wrote a Q&D BASIC filter program to "cleanse" LISTed programs of special characters. This took about 5 minutes, so I'm guessing that someone has already written something a whole lot better. Is anyone familiar any filter programs such as this?
Thanks,
Larry

If it works like the one I have, just highlight the files you want
by clicking on then goto the options drop down menu and choose
extract.

I am not really sure about the above, but you may want to try and
see if there is a video converter device with a S-Video out port.
I have one that I use with my 8-bit so that I can use it with a
VGA monitor, but it only has a S-video in port.

# 6147. eBay idiots

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-22 23:55:02 UTC
From: Roy G Biv <8-bitter@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.56.0311221819470.16421@shell1>
Source record: 18260

On 13 Nov 2003 at 05:31:55 -0800, Ben Yates scribbled:
->However, the truth is that in todays world, customer service is
->lacking. If you want to be the customer's choice, you need to pro-
->vide *excellent* and *consistent* customer service. It is this rea-
->son I believe some computer users would rather deal with eBay than
->dealers, because some dealers are just rotten.
->
->This has been really evident in the TI community, where dealers have
->walked off with the $$$ without sending the product *many* times.

The above seems to be a rather confused rant. The poster indicts
all businesses because he says *some* are bad apples. Then he blames
the TI community (which this isn't -- this is the Atari 8-bit commun-
ity) based on a vague anecdotal allegation. Then he praises E-Bay,
as if E-Bay is a utopia where no untoward incident has ever occurred.

<sarcasm ON> The poster seems to be out of touch with Atari tra-
ditions. In the Atari world it's traditional to attack dealers be-
cause of irrelevant alleged personal factors (according to non-cus-
tomers), in spite of their providing excellent and consistent customer
service, as attested to by their customers. <sarcasm OFF>

The result is that the dealers are driven off this newsgroup, or
out of Atari, because (as one said here a while back) they're afraid
to post here because of the irrational flaming. So we wind up with
no dealers, which forces everybody to go to E-Bay. Is that progress!?
Or maybe an underhanded E-Bay plot, or what? In any case, we suggest
the poster save his whining for the TI community. We don't need more
whining here! <grin>

## 6150. The Good Years: 1983 (was: Who remembers GAUNTLET?)

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-23 03:13:11 UTC
From: Roy G Biv <8-bitter@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.56.0311222111130.20370@shell1>
Source record: 18263

On Mon, 17 Nov 2003 at 09:59:07 -0000, "Gareth" scribbled:
->Now I remember why I never actually managed to buy an APX prog -
->the price of APX programs was crazy: in 1983 it wasn't uncommon
->for an APX cassette with 1 prog to cost around $30 ...

In 1983 every program, cart, disk, book, or whatever, for 8-bit computers cost $20 or $30. For adults who had jobs and thus had money, that wasn't "crazy." In fact, it was only a small part of the $500 to $1000 it cost to put together a full-fledged Atari or Commodork computer system, which was less than the $2000 to $3000 an Apple 2 system cost, not to mention the sky-high $10,000 and up for a gold-plated "IBM" system. (The IBM PC alone cost five thou!)

When I bought my first Atari 8-bit computer, I walked out of the store $550 poorer ($250 less a $50 rebate for the 400 computer, plus $300 in other odds and ends including a Basic cart, a Ms. Pacman cart, Frogger on cassette, a cassette recorder, the Lon Poole book, and not much more), and it took thousands of swords in additional expenditures over the years before I built that up into a full-fledged 8-bit system. (Discarding along the way several generations of old printers and modems and other stuff before reaching the components of what became my present 8-bit system.)

The price wars that did in Atari and Commodork came along a year or two later, and at that point prices fell thru the floor, but in the early '80s $30 was a normal retail or list price for an 8-bit program. Some cost $40 and a few cost more than that. In 1983 minimum wage in the U.S. was somewhere around $3.25, so at that time a soda jerk flipping burgers at a fast food joint for up to four bucks an hour would've worked about one day in order to afford to buy one 8-bit program item. For anybody with a "good" job making $10 or $20 an hour, it would've cost only a couple of hours' worth of time. So I wouldn't describe $30 in 1983 dollars as "crazy."

# 6151. Indus GT w/RamCharger for CPM

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-23 04:20:09 UTC
From: Roy G Biv <8-bitter@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.56.0311222243230.20370@shell1>
Source record: 18264

I seem to have lost the name of the original poster who scrib-
bled this on Sat, 15 Nov 2003 at 06:19:04 GMT:
->I have about 8 Indus GT drives I have collected over the past few
->years.... the point for this message is that ONE of the Indus GT's
->I bought has the Indus RamCharger installed to run CPM...but I have
->no idea which of the drives it is, externally they all look almost
->identical. How can I tell if a[n] Indus Drive has a RamCharger
->installed?

Have you tried weighing them? I would imagine that the one with
the extra board inside should weigh a little bit (a few ounces?)
more than the regular ones. (I'm too lazy to dig out all of the
working and nonworking Induses I've got boxed up to see if this
idea works. Its success would depend on the weight being consis-
tent.)

A slower but slightly amusing way to tell would be to use them
all for many hours at a time. The one that overheats (and stops
functioning normally) should be the one with the CPM board inside.

(Been there, done it! <grin!> Note: if you plan on using it in
CPM mode, you may need to keep it chilled down to avoid the over-
heating problem.)

If you have the CPM disks and instructions, you could try using
them all in CPM mode; the one that responds to the proper commands
would be it. However, that tactic would fail to pinpoint the right
one if the CPM board was a dud. (Not that there's any reason it
should be a dud; it's just that anything's possible.)

That leaves the only sure-fire way of proving which one it is:
Open 'em all up and see which one has the board installed! (Natur-
ally, it'll be the last one, so the easiest advice is to open that
one first! <grin!>)

# 6152. Micro-Palooza Party, Dec. 30

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-23 05:40:55 UTC
From: Robert Bernardo <rbernardo@iglou.com>
Message-ID: <Pine.GSO.4.56.0311230029340.26816@shell1>
Source record: 18265

Ever since September 13, we've been in talks with Anthony Ramos, co-owner of Ground Kontrol in Portland, about having the first ever Commodore/Amiga party in the Pacific Northwest. And now, the party is a "go"!

Why should this party interest Atari users? Read on!

The Micro-Palooza Party, is Tuesday, December 30 from 1 p.m. to 10 p.m. at Ground Kontrol, 610 SW 12th Avenue, in downtown Portland, Oregon, USA. Ground Kontrol is a retro-arcade establishment with all the good games from the past, like PacMan, Tempest, Star Trek pinball, etc.. Also Ground Kontrol has a number of Atari items for sale, like Atari 2600's, 5200's, and peripherals. http://www.groundkontrol.com

Anthony Ramos has agreed for us to set up some Commodore/Amiga computers there and to invite computer bands to play music on the mini-stage. Anthony is also is quite a concert organizer. Four micro-computer bands will play live music at Micro-Palooza. Now confirmed, Seth Sternberger of 8Bit Weapon will fly all the way up from Los Angeles, and gotoXY is coming in from Eugene, Oregon. The other bands coming for the event are MOS-8 and Waxin' Wary, both from Eugene (the city must be a hot-bed of micro-computer music activity!). Seth is trying to get the band, BitShifters, to come all the way from New York!

Some details on the bands. 8Bit Weapon uses Commodores and Amigas when playing their music. gotoXy uses a variety of 8-bit platforms including Commodore, Atari, and Gameboy in playing their music. BitShifters is another Gameboy-inspired band. Seth of 8Bit Weapon will be selling his band's CD's in limited-edition "floppy disk holders" -- two CD's for $10.

To find out more about 8Bit Weapon, go to

http://www.brainscream.com/seth

To find out more about gotoXY, go to

http://zebox.com/gotoxy

The bands are now scheduled to play music from 6 p.m. to 10 p.m.. (If BitShifters come in, then that beginning time will change.) When the music starts, computer devotees will be asked to pay a $3 cover charge. The general public will be asked to pay a $4 cover charge.

In attendance will be myself, Dave Moorman of Loadstar disk magazine, Jeri Ellsworth of CommodoreOne fame and an Atari fan (yes, convince her to port the Atari core over to the C-1),, and possibly, Dale Luck, Amiga programmer most famous for the Boing Demo. The following C=/Ami

groups which have been invited and which have responded positively to the party are: the Amiga/Commodore User Group of Astoria, Oregon; the University Place Commodore Home User Group of Tacoma, Washington; and the Commodore User Association of Medford, Oregon. I'd like to invite any and all of our Atari bretheren to join us, too.

Of course, the public -- those who walk in through the door -- will be welcome to use our computers as they go in to play with the arcade machines.

The party will be a relaxed affair -- just playing computer games, eating pizza, drinking soda, listening to music, and lots of talk.

On a side note, we're trying to get newspaper, radio, and television coverage of Micro-Palooza.

Come and celebrate the holidays with us on December 30! Come to Micro-Palooza!

Truly,
Robert Bernardo
Fresno Commodore User Group

From: Wilheim <guillermo@mail.cl>
Message-ID: <bppitl$1pa$1@news1.nivel5.cl>
Source record: 18266

Hi, everybody.

As we now, Alley Cat. has an incompatibility problem with the XL/XE models. Of course, this can be fixed of course replacing the OS ROM to the one used in 400/800 (Translator, FixXl). My question is: does anybody know what exactly is the incompatibility problem?. I disassembled the program trying to find an illegal call to the OS, but I didn't find it.

# 6154. Re: Alley Cat: XL incompatibility problem.

Source record: 18268

Hi Roy-
Yes, one might be able to find the difference by weighing them -- good idea.
Also, the RamCharger was used in the Indus as a track buffer, so booting the
mystery drive should sound like a Happy drive (or some TRAKs), provided it did
not have to be software activated. Another possibility is that the Indus
diagnostics may detect it. Diagnostics were available at Best Electronics.

Congratulations, well done!

I've been working as a "Software Engineer" on smartphones for almost a
year now, using Symbian, C++, J2ME. Even cellphones these days have a
fair bit more memory and CPU power that the Atari did, but they do
lack PMGs, DLIs and other cool features, the low-res graphics
experience will come in handy!

Good luck!

On 23 Nov 2003 at 13:37:46 GMT, Larry White scribbled:
->Another possibility is that the Indus diagnostics may detect it.

Well, here's another way. The original poster wanted to know how to identify the Indus with the CP/M board installed without having to open up all the drives. The answer seems simple: the Indus will either boot up in CP/M or it won't.

In order to get to the bottom of this I've dug out my CP/M disks and the huge <ahem!> three-page instruction manual provided by Future Systems back in 1986. The manual says to boot up the disk with the terminal progam with Basic disabled. It says a menu ("D1: REM:") will be displayed, at which point the user types F for a 40-column display or E for 80-columns, and hits RETURN.

That should be all that's needed. An ordinary Indus, like the ones I currently have hooked up, apparently just hangs -- with no "menu" display as described above. Only the mystery drive would work right, at which point the user can go on to step two -- which is to insert the CP/M boot disk and then, while holding down the drive-type button, press the error button. Hit RETURN and voila! you're in CP/M! Only the drive with the extra 64K RAM board will do all that.

Using Atari800Win Plus 4.0 I discovered that the extension can be
anything the menu 'autoboot image' will always load and execute.

Is this just incidental (meaning only valid for some files) or is this
the regular behaviour?

Hi Wilhelm -

There were quite a few games that required "The Translator" to run on the
800xl.
I had an 800xl growing up.......so I used the translator. I had 2 friends
that had the 800.
At the time, I knew what the issue/difference was! But I no longer
remember.
If I do recall, I'll send a post.

I used to keep the games that required the xlator, all on the same
disk(s) - - separated from the others.

The Indus needs the Synchromesh software loaded into the drive to
run at high speed. The RAMCharger 64K buffer needs Synchromesh II loaded.
One of these two files must be on the disk you boot from to kick the Indus
into high speed mode. The RAM Charger board is installed on a set of
internal pins along the right side of the drive. You maybe able to see it
by looking up through the vent slots on the bottom of the drive. But why
not just remove the 6 screws that hold the top and back covers and look
inside???

It was strange to see (and hear!) the Atari computer access the
drive without the drive ever spinning. I ran CPM on the Indus drive for a
while too. The hardware worked, but my biggest disappointment was that
the Synchromesh software only worked with DOS XL. A firend of mine
disassembled the SYncrhomesh software and said it was basically
just loading the Z80 code into the drive. Despite a lot of searching I
have never been able to find a modified Synchromesh file that worked with
SpartaDOS. So, the best DOS for the Atari was never able to take
advantage of the best disk drive!!!

I forgot to say....

I don't really recall any of "my favorite" games being in the "translator
required" group.
But I do remember, for instance, "Shamus" needed the translator....it only
played on the 800, not the 800xl.

damn....I wish I could remember more....now it's bothering me.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> remember.

Most likely, the GTIA TRIG3 shadow register at 0x3fa. If that's overwritten (for example, because a player/missile buffer is placed there) then the Os vertical blank assumes that a cartridge has been inserted and stops the system.

So long,
Thomas

# 6167. Holme's Atari CDs - Thousands of Atari Games

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-24 10:46:48 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <b1ac20d10e35e6eeab7d7c96196fda57@news.teranews.com>
Source record: 18280

Just wanted to put up a reminder that I have a copy of the Holme's Atari CDs and make them available to anyone that wants a copy. Ever since I got a new CD burner that is more efficient and faster, I believe I dropped the price down to $10. That includes shipping, the CDs, handling, packaging, etc. etc.

On the CDs is lots and lots and lots of old Atari games and programs that are simply not available anymore.

Of course, I get filthy rich off of these CDs, selling them for $10. Already, I am into buying my third home off in some Caribbean Island with the revenue that I have made. So please help support me and my family so we can afford that third home.

On a more serious note, if you want the CDs... keep the subject line intact when you reply. I get a lot of spam mail and might not see your reply if I don't recognize the subject line. I also take (and even prefer) paypal, sent to this email address.

# 6168. Re: Who remembers GAUNTLET? (console + PC related)

Actually what I'd like to see is a Gauntlet classics Xbox Live enabled
package. It would include Gauntlet and Gauntlet II as 4 player online
enabled Xbox Live games. I'd also like to see Gauntlet Legends done as an
XBL title -- note Dark Legacy (or whatever it was called, it was too "dark"
the graphics not the story line).

# 6169. FA: GEMSTONE WARRIOR, KORONIS RIFT and much more...

HI all,

currently I have a huge lot of classic games (International Karate,
Wizard's Crown, Gemstone Warrior, Koronis Rift, Ballblazer, Summer
Games, The Pawn, etc. etc.) for the 8-Bit Ataris up for auction. You can
find them here

http://cgi6.ebay.de/ws/eBayISAPI.dll?ViewSellersOtherItems&include=0&userid=chrodegang&sor
t=2&rows=25&since=-1&rd=1

I ship worldwide and I accept PayPal payments.

Thanks for your attention,

Andre

I think I found the 'undocumented' way to win, but I was never sure.

If you solve certain puzzles the program pretends to stop with an error.
One of the ways suggested to 'win' was to unplug the computer and walk away.
I've never been sure how 'legitimate' my solution was though.

- Mike

Here is a copy of an article I wrote back in 1987. Ihope it helps. Paul

A-T-A-R-I

Answers-Tips-and-Relevant Information

by Paul Alhart

I really like my 1200XL, but at the same time I really hate having to use the TRANSLATOR to boot up certain software. What to do? I Translated the offending software to run on my system and filed my Translator Disk away in the back of a drawer somewhere. You can do the same. In the beginning, Atari said, "If programmers use the PUBLISHED VECTORS into the Operating System (O/S), their programs will run on ANY 8-bit Atari Computer." (IF is such a big word.) To make a long story short, some programmers did not follow this rule, but to save a few bytes, jumped right into the )/S. This was fine before the XL/XE machines came along with a different O/S. The published vectors are still the same as Atari promised, but they point to different locations in the O/S. The following list gives the published vector location and the vectors name followed by the ILLEGAL O/S entry points. If you find that a program Jumps to F3F6 to open the screen, (20 F6 F3) and you have an 800XL, change the code to (20 8E EF). Remember: Low byte/High byte. I have found this to be the most common ILLEGAL jump. The next most common are the "K: Get/Put" calls. I spent many hours Peeking into my operating system with a lot of help from Compute's Mapping The Atari to come up with this list. It now saves me lots of time and hopefully will help you also.
Note: Translated software will only run on the O/S that it has been translated for, so keep an original copy as back-up.

Back to the days of Beta VCRs, gas shortages, audio cassettes, VINYL records, an economy on the down swing, Jimmy Carter, and the possibility of a scary red nation nuking the crap out of us while we sleep?

Whereas today, OTOH, we have Enron (and other like-minded companies), Osama/ the Taliban, N. Korea, an economy on the down swing, Geeyorj DUBYA Busch, over-inflated gas prices, and CD & DVD players.

Um, lessee... The only things that have really gotten any better (aside from computers/electronics in general) is the media we listen to our music & watch our movies on...

How about a coin toss to decide, guys? :)

richard cortese <ricortes@earthlink.net> wrote:
> Are they going to be set up as single player game or can we expect some
> Doom/MMPOG in the near future?

Based on what I see these phones capable of, don't expect a Doom clone
any time soon. ;^)

Unfortunately, the projects been put on hold for the moment
(competition cropped up and released something similar before we had the
chance, and the company I'm consulting for wants to wait and see if they
target lots of other phones, or if we'll be able to fill in the gaps :^)
Not all games run on all phones; the phones are all so different,
in capabilities. It's just the API and CPU arch. is the same...)

They've got some other titles they're thinking of having me write
(all classic-style action games), so I should HOPEFULLY remain busy for
a while. :^)

Not that I'm getting a huge salary, but I hope they can afford me for
the long-run! It's just that typical cellphone games sell for < $10.

I guess, though, if the market is big enough, since you CAN literally
get a playable game written in about a month, so I guess the development
costs are alot less than the $40/pop games for PCs and PlayStation.

Hrm, I'm rambling, sorry... Just finished another 2hr of writing some
prototype code... WHEW!

Yeah, I seriously miss the graphics-indirection stuff the Atari had
(memory pointers, DLIs, etc.) >:^/

Fortunately, the CPUs are _almost_ enough to let one brute-force it. :)

BTW, Gem Drop X, the SDL port of my Atari game Gem Drop, is out for
Ericsson P800 (I think?) Symbian phones!

http://www.newbreedsoftware.com/gemdropx/

I have NO idea who did the port, but it's out there, so I grabbed it and
stuck it on my FTP server. ;)

## 6180. M.U.L.E.

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-25 22:35:28 UTC
From: Winfried Trautsch <bluedino@spamcop.net>
Message-ID: <slrnbs7m9g.f7q.bluedino@winnux.winnisurf.de>
Source record: 18293

I'm looking for M.U.L.E for 800XL.
It was (and still is) one of the best games ever IMHO.

Does anyone actually wants to get rid of this dusty old disk, manual and cover? ;-)

I spent so many hours playing it, but I never got the chance to actually purchase it. So all I have is a floppy disc of unknown origin. And an ATR. ;-)

Same goes for Trailblazer...

## 6182. Software that Works with Emulators

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-25 23:55:55 UTC
From: llppwhite@aol.comnsp
Message-ID: <20031125185555.27944.00000930@mb-m06.aol.com>
Source record: 18295

Is anyone aware of any list/compilation of Atari 8-bit software that is known to work with the various emulators? I've not used emulators very much, but most of what I've read about things working/not is related mostly to games working properly. I'm thinking more about applications, systems software, etc.

If there is no such list, it might be a useful addendum to the FAQ's.

Thanks,
Larry

Larry,
That's a great idea.
I *had* my own table/chart of game vs. emulator but it's now too out of
date. I started this for my own good because there were so
many emulators and versions out there. And sometimes a newer version may fix
one problem, but break another!

I listed emulators PLUS a few various versions of the emulators (which makes
it a little more difficult/complex).

One problem is this : It does make a difference what PC you have.....you're
own machine's Mhz, memory, video card, sound card, etc...
So, you may list: Game X doesn't work too well with Emulator Y....but it
could be just that way on your own PC.

BUT anyway, I'd love to see a list. If I had time, I'd even contribute to
testing & posting results.

I agree, MULE was/is the greatest.
Are you looking for the actual original MULE diskette? I guess so. The
.atr file is too easy to come by.
Hey, you want the manual & cover too? Jeez.... How about a cover autographed
by Trip Hawkins?

I actually have 2 original MULE diskettes but only 1 cover & 1 set of
directions.
I'm sure you can find it complete on either e-bay or from another person on
this message board that deals in atari stuff.

I enjoyed MULE so much, I made a page on my web site for it:
http://home.comcast.net/~zabagar/muleweb.html

Yes in the right place. When I select machine type 5200, I do get the
Atari logo with rolling colors. When I 'insert' a cartridge then either
the screen shows garbish or a message 'Atari machine has crashed ....'
pops up.

From: RoyE <r-dean@charter.net>
Message-ID: <vs95q4m8ps5sd1@corp.supernews.com>
Source record: 18201

If you are sure that the rom image is good and you are using Atari800win.exe versions 3.1 then if you press the ALT+C keys at the same time a fileselector appears and you can select your rom if you know the directory structure of the Filemanagement system. OK This should get you another dialogue box asking which rom type 1 chip or 2 chip, select either or and if it doesn't run or crashes then--- Select the 2nd chip setting. If it still crashes or shows gibberish then you have a bad ROM. Another way is to make sure that file associations is set for your rom types then rename the Rom with this extender.... .CAR
extender CAR tries to detect the type of rom and self load. Then you can just double click the filename and emulator should open and start playing the ROM image... Try the F1 key it helps alot also..

RoyE

## 6190. Full text of Digital Deli on the Web

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-26 19:28:51 UTC
From: Kevin Savetz <usenet-DELETEthisPART@savetz-DELETEthisPART.com>
Message-ID: <usenet-DELETEthisPART-3FDC58.11285126112003@news.west.cox.net>
Source record: 18203
Cross-posted to: comp.sys.atari.8bit,comp.sys.cpm,comp.sys.apple2,comp.sys.sinclair,comp.sys.tandy,comp.sys.ibm.pc.classic

The folks at AtariArchives.org are thrilled to announce that the full text of the classic computer book Digital Deli is now available on the Web. Published in 1984 and subtitled "The Comprehensive, User-Lovable Menu of Computer Lore, Culture, Lifestyles and Fancy," Digital Deli offers a unique perspective on computers and their users in the golden age of microcomputing.

It is available at http://www.atariarchives.org/deli/

The book was written by more than 100 contributors and edited by Steve Ditlea. Contributors include computing pioneers Ralph Baer, Steve Wozniak, Nolan Bushnell, Robert Moog, Bill Gates, and Mitch Kapor, in addition to well-known writers and pundits, such as Stan Veit, Steven Levy, Howard Rheingold, and Esther Dyson.

In it, you can read:

- how Paul Lutus wrote the Apple Writer word processor in a tiny, secluded Oregon cabin
- how Ken Uston used the first practical computer to count cards in a Las Vegas casino
- about the development of RACTER, early software that would synthesize prose
- about Blaise Pascal, Ada Lovelace, and other great "computer eccentrics"
- about John Draper and other pioneering phone phreaks
- about online etiquette circa 1984
- ...and much more

"I've always been struck by how much of the history of technology is missing from the Net. It's as if anything predating the World Wide Web's creation simply didn't exist," Steve Ditlea, editor of the book, said. "Thanks to atariarchives.org anyone curious about the state of personal computing circa 1984 can now access a book that has been out of print for nearly two decades."

This is the 21st classic computing book to be made available at AtariArchives.org. The site launched in April 2000 with the goal of digitally preserving books, software, and other information about classic computers.

# 6191. problem with roms.

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-27 11:28:21 UTC
From: AnToNio <BedenkEensWatLeuks@HotMail.com>
Message-ID: <BedenkEensWatLeuks-A8817F.12282127112003@news.fu-berlin.de>
Source record: 18204

The Space Invaders and Pacman were always my favourites. So it is a bit disappointing that (using Atari800winplus) that the games do not work as expected.

Problem with these games is that it looks like there is something wrong with settings.

In Space Invaders I can shoot down the Invaders but they cannot harm me (looks like problem with collision detect) also when the first round is ended, all freezes and there is no second rounr.

With Pacman it is similar. I cannot eat the pacman (although they are turned blue) and also they cannot harm me.

on the other hand, others games (e.g. ms pacman) work fine.

I already did a 'Misc|Clear all settings' but to no avail.

Anyone know the problem?

I bet you are using the 4.0 Beta of Atari800WinPlus, it still has a bunch of collision detection problems. Try using an earlier version, like 3.1 and that should fix you up.

On Tue, 25 Nov 2003 at 08:59:16 GMT, in response to the question
"... is there anyone here that would trade 1985 and beyond for 1980
again?" David Bowden, "The Undead Mechanic," scribbled:
->How about a coin toss to decide, guys? :)

No need for a coin flip! To answer the question literally, I'll
say Undoubtedly Yes. I.e., yes, I'll trade 1985-present for 1980
again. Sometimes I can't believe that the 1980s now constitute "the
good old days"! <grin?> or <groan?!> At the time, back in the '80s,
except for a few things like the Atari "home" computers, I sure
didn't think that those times were very good. But enough of that.
Let's get back on-topic!

# 6196. The Good Years: 1983

Newsgroup: comp.sys.atari.8bit
Date: 2003-11-27 18:27:38 UTC
From: Roy G Biv <8-bitter@the.good.old.atari.days>
Message-ID: <Pine.GSO.4.56.0311271243250.7860@shell1>
Source record: 18209

After I posted....
->> When I bought my first Atari 8-bit computer [in 1982], I walked
->>out of the store $550 poorer ($250 less a $50 rebate for the 400
->>computer, plus $300 in other odds and ends ...

... on Tue, 25 Nov 2003 at 19:37:42 GMT, Bill Kimbelton scribbled:
->Geez Dave, where the hell'd you buy the thing, the old Swallen's
->store on Glenway Ave?

Actually, it was Video Barn in Withamsville, about 25 miles east
of Swallens on Glenway. However, I did scrounge around at all the
Swallens and Gold Circles, including the one on Glenway, looking for
rolls of paper for the 822 printer. (I eventually got a supply at
the Atari headquarters building when I visited Sunnyvale in 1983.)

$250 for an Atari 400 (with only 16K and a membrane keyboard!)
may sound high, but back in 1982 that was "low," reflecting a recent
price drop. My computer mentor said he paid more than that only
three months earlier. The original price had supposedly been $400,
thus the name designation. The $50 rebate brought my outlay down
to only $200 -- but within the next year it cost another $225 (!) to
upgrade that 400 to full 48K memory and install a Cherry keyboard
with real keys! (I had to do that: I wore out the OPTION key! As
I recall, that key was essential for using the cassette recorder or
playing video games! <grin!>)

Incidentally, the point of my earlier posting was NOT to make fun
of the guy who said that $30 was big money. Rather, my point was
essentially to agree with him. Everything cost $20 or $30 or $40,
and by the time you got thru buying all the things you needed to
get a whole computer system with all the peripherals and all the
software, the total cost added up to a couple or several thousand
dollars. (And more for Applers or IBMers.)

Or for us serious "home" computer addicts back in those days,
more than that! Which is to say, more than we -- or our wives! --
would care to admit to! Do you remember the treasurer of the local
Atari club at that time? He had FIVE Atari computer systems! And
those were *all* 8-bits!!! <grin>

You have already received a couple of replies with all
information you need, how to continue with this incompatibility
issue.

I have a question to you: What is the effect of the
incompatibility? Does the game stop at an early stage of the
loading sequence or start up?

Thanks!

My general advice for troubleshooting this type of
incompatibility problem is:

Insert a machine code loop that writes random values to the border
colour register at an early stage of the game code.

Load and start the game.

If you see the random colour effect, the modification you
inserted is obviously before the problem location. In that case,
take the original game binary and put the random colour loop at
a new location, on a higher program address.

Repeat this until the random colour loop cannot be seen, the
problem (in this case the warmstart) shows.

You have now identified the area where the problem is
located.

One advantage with this method is that you do not need to
read and analyse all the compatible, problem free code.
Instead, you can concentrate on the area where the problem
is located.

There are many examples of problems and conditions where
this method does not work. The problem has to have a
connection to execution of a specific code sequence. Games
that have built-in decompression or decryption of executable
code are more complicated to handle.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

If you had the 4-joystick adaptor, you could play Gauntlet II with 4
players on the ST. AFAIR.

Hello folks,
are there any schematics or hand-drawn plans available for the
stereo-upgrade (2nd Pokey) ?!? Besides the description of Chuck
Steinman, I would like to have such a plan or schematic... greetings,
Andreas.

Hey everybody - finally found myself a sweet looking Atari 800, dug out the copy of THE GOONIES I bought on 5.25" diskette a while ago and noticed that the disk has a crease in it ... GRRRRRRRR.

If anybody has an original copy (not bootleg) on cassette or diskette, please email me - thanks!

Also, please accept my apologies if this message got posted twice.

> claiming that you read to the bottom??? (Yes, I know he plonked me).
And if everyone did the same, those people on modems will spend longer
downloading it, the server storage requirements will go up etc. Happily
most other people are more considerate.

> Learn to use usenet, Gareth (don't just blindly depend on the "rules"
I've only been using it 14 years so what the hell do I know.

Bottom line is you were wrong to do what you did and no amount of
posturing will change that.

# 6222. Re: Atari 800 "GOONIES"

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-02 14:26:12 UTC

Source record: 18236

Well, I've downloaded what looks like the tape image of the game (two pieces, called GooniesA and GooniesB). I know the disk image is one side only, because the legitimate disk I have is Atari on one side and Commodore on the other. I don't have any software that turns these tape images into audio files like I had for Commodore tape images, though.

In the mean time, an ATR disk image would probably work, but I don't have an Atari disk drive right now - just the 800 unit. Plus, I'm a huge Goonies collector, so I'd like a copy of the "legitimate" disk that works ... I still can't believe the idiot I bought this from put the thing in a paper envelope and expected it to get here safe.

You know, it's one thing to top-post, breaking one of the more articulate
and 'loose' of Usenetituette's terms, the rules are there for ease of use by
others; a common courtesy if you will. That said, trying to be a rebel by
flaunting that particular courtesy makes you look less like a rebel and more
like a....choad, really.

Dr.z3n

I still use Atariwriter every now and then when my bubblejet runs dry.
I have an old Atari 1025 printer that uses the old typewriter ribbons. I can
still find those for about $6 compared to the $35 ink carts for my canon.

You could try the XLsearch and get the CAS2WAV program and transfer them to tape that way. BTW I had an original Dragons Lair folio sent to me and the mailman bent it in half to fit it in my mailbox like it was a magazine or something. Good thing I had the disk image.

Ok,
FTP to , xp.ivn.cl , user a8 and pass a8.
Under Games/ATR/G/ are goonies.atr, gooniesA & B.atr (the first one is the
game, the others two.. dont know)
many of the things i had, i used to have the original disk... But died long
time ago.
Also, i'm trying to sort this things, couse they are pretty messy

Best Regards ;)

# 6232. drum kit out of my 8 bit

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-03 15:34:09 UTC
From: soularinflux@aol.com
Message-ID: <20031203103409.26263.00000097@mb-m06.aol.com>
Source record: 18245

atari heads,

with the time i have managed to afford myself i come to this project. i am a drummer and drummers make lots of noise. i am not allowed to make noise. drums cost lots of money especially electronic drums(the kind i need to play quietly). i am trying to use some of my 8 bit 's as a drum machine. i plan to use a computer for each drum. minimum 3 computers. i have a parrot and i made an antic sampler. was thinking i would be able to use basic to take care of the semi untaxing job of one drum per computer, but i think i need assembly to make it as responsive as I need it to be. i have read alot over the past year on 6502 assembly on my Atari. i think if i tried i may in a matter of monthes be able to do something, but i notice amongst the available software that some of you , who i believe still post here have done some work in this area. the variouse drum and synth progs are more than i need. now i know some of you could bust out a simple solution to my problem in an instant. can someone help me here. either direct me or help me with this need if you can because i want a stack of 800xl's next to variable switches that i can pund on and maybey use in some real music. i believe that one machine per drum would most certainly be overkill as far as capability.

Atari is still my favorite machine even over these gig machines. 4 ehh ver

Why does console games discussion get cross-posted into
comp.sys.ibm.pc.games.strategic? Anyone who wants to play Gauntlet or
Gauntlet 2 on a PC platform has long since running it in an emulator.
Such news are completely pointless to this ng.

On 16 Nov 2003 16:53:08 -0800, mike_norths_toupe@hotmail.com (Mike
North's Toupe) enlightened us by scribbling this gem of wisdom:

Gauntlet II came out in 1986, not 1988. I actually played it at Time
Out (In Cerritos Mall) around 1987 ....

It would be nice to see Gauntlet II released, as well as an enhanced
version with more / faster monsters, different mazes, etc.

<Gibs> When you kill 6 people in Unreal Tournament
it is "MonsterKill", In Quake3 it is "Excellent",
in Counter-Strike it is "Kicked by console"

# 6239. FS : boxed+new ATARI 800 XL/XE cartridges

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-04 23:57:21 UTC
From: bobbygehtheim@yahoo.de
Message-ID: <831dc9f8.0312041557.258213d6@posting.google.com>
Source record: 18152

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide :

$7 1 game surface mail (slow)
$9 1 game air mail (fast)
$14 for a package of up to 15 games as surface mail (slow , 3-8 weeks)
$32 for a package of up to 40 games as surface mail (slow , 3-6 weeks)
$23 for a package of up to 8 games as Air Mail (fast , a few days)
$33 for a package of up to 15 games as Air Mail (fast , a few days)
$48 for a package of up to 40 games as Air Mail (fast , a few days)

Europe : please ask

Please note : Paddles/Joysticks/Keyboard Controllers weigh about 3 times as much as 1 game.

And "Eastern Front" weighs as much as 2 games because of instructions and map , Gato,Star Raiders 2 and Tennis about 1.5* as much as the other games.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias Graef

bobbygehtheim@yahoo.de or lord-chaos@t-online.de

(my old account ulrich_sternaxe@gmx.de was spammed to death,so itï¿½s mailbox uaually was full after a few hours.Yahoo has a better spam-protection).

XEGS carts are the cartridge games in the blue XEGS boxes.They work on ATARI 800 XL , 800 XE , 65 XE , 130 XE and 1200 XL and the XE Gamesystem.

Some require 64K, so they woni¿½t run on the ATARI 800.

If you want to see pictures of the gamesï¿½ boxes,instructions and carts,
please use the links.

What will your interface be, exactly? e.g., how will you 'strike' the
virtual drum on the Atari? Do you already have hardware for this, or
will you be building something?

Once upon a time, I made a little 'drum' thing out of a joystick controller
cable, the back of a broken PC case, a little wire, a pencil, and lots of
aluminum foil and tape. :^)

Touch the pencil (whose tip was covered in foil, which was wired to GND
on the controller port) to the various areas of foil on the case, and it
triggered different joystick directions and/or fire. (e.g., 4 or 5 spots
were available to hit).

I also had the thought that it would work as a giant touch-pad for
letting little kids navigate games and other programs. (Only 4 or 5
giant spots to touch; no 60+ button keyboard; no trying to point at things
with mice or joystick controller.)

> i plan to use a computer for each drum. minimum 3 computers. i
> have a parrot and i made an antic sampler.

If you could live with much lower quality sounds, you could synthesize
them, rather than use digital samples. That way, you could do four
concurrent sounds per computer. (Use the 5th channel for a metronome, even!)

Just have a routine that spins, waiting for any joystick input.
If it sees 'Left', for example, it'll say "Okay, I'm going to start
playing the cymbal effect on channel 2."

Using VBIs is probably the best way to do it, but for drum effects,
even something like plain TurboBASIC could do it!

```
1000 S=STICK(0)
1005 IF S=11 THEN CYMBAL_VOLUME=15
...

1100 SOUND 2,0,0,CYMBAL_VOLUME
1105 IF CYMBAL_VOLUME>0 THEN CYMBAL_VOLUME=CYMBAL_VOLUME-1
...
9999 GOTO 1000
```

Or some-such :) Depends on how complicated you need the sounds to be,
I suppose...

* I have a (large) PC Mirror folder that has 5 or 6 files in it.
* One file is named "TCMJAN04.TXT"
* I have D5: set to an APE PC Mirror folder where this file resides.
* If I do a directory on D5: then MyDos says that the name of this file is "TCMJAN_1.TXT"
* I am quite sure that TCMJAN04.TXT is a legal file name in MyDos.
* Perhaps has something to do with CR/LF used in the PC Mirror?

Has anyone run into this before?
Thanks,
Larry

Source record: 18156

Sounds like a cool idea! You could connect two Koala Pads up to the Atari and use those to control 2 digitized sounds. (I wonder if you could write something to detect movement on the pad and correlate that to sweeping or pad effects...) Heck throw SAM in there for some cool voice! :)

Also, take a look at the Midi Interface for the 8bit:

http://www.republika.pl/ixkuczek/ixkuczek.html

I don't speak much Polish, but the schematics and .com files should be straight forward enough....

Imagine a group like the Blue Man Group, but with all Atari hardware. :)

Best of Luck. I always enjoy a good Atari project.

Chris

# 6244. CAS archive?

Newsgroup: comp.sys.atari.8bit

Source record: 18157

Hello!

I know this topic popped up here and there during the last few years and I was just seaching all csa8 for a CAS-archive. All known links are dead by now, so if anyone knows where to download some CAS files, please let me know.

Don't get me wrong, there's nothing wrong with ATRs, emulators and stuff, I'd just like to try some things out, esp. tapes that were multi-loading etc.

JMP $E477,

Frank

# 6245. Re: APE/MyDos Question

Message-ID: <482f186a.0312050929.9613209@posting.google.com>
Source record: 18158

I have seen this, but only with files that are longer than the 8+3
FAT16 standard.

What happens is if the file is a long file say, "FILENAME_LONG.TXT",
it becomes "FILENA~1.TXT" to DOS. Since there is no '~' on the Atari,
APE turns the '~' into an '_'. The filename will become
"FILENA_1.TXT" to APE.

Check to see if there are really any preceeding or trailing spaces in
the filename (maybe the file is really "TCMJAN04 .TXT"), but since it
looks like it is only 8+3, it should be okay.

Cheers,
Chris

Source record: 18160

The full text of the classic book Atari Player-Missile Graphics in BASIC by Philip C. Seyer is now available at http://www.atariarchives.org/pmgraphics/

The book explains how to design, use, and animate player/missile graphics, including collision detection and other essential functions. All of the book's example programs are available for download.

The book was originally published in 1984. It is the 22nd book to be made available at AtariArchives.org.

Enjoy.

Hi Chris,

> I have seen this, but only with files that are longer than the 8+3 FAT16 standard.<

Thanks very much for the reply. I also found out that Win allocates a number of spaces for the filename depending on its initial length. This filename was originally "TCM January 2004.txt" then shortened to 8+3 for MyDos. But Win evidently doesn't reallocate or re-type the name. It was treated as a long filename, even though it was 8+3. Interesting!
Thanks, again.

# 6249. Announce: Simple 65c02 simulator for Linux

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-06 04:31:39 UTC
From: Sheldon Simms <sheldonsimms@yahoo.com>
Message-ID: <pan.2003.12.06.04.31.36.121795@yahoo.com>
Source record: 18162
Cross-posted to: comp.sys.apple2,comp.sys.cbm,comp.sys.atari.8bit

Hi all...

I want to announce the availability of a new 65c02 emulator for Linux/GTK2. The program doesn't do much right now, it's just a GUI wrapped around a 65c02 emulation that I wrote several years ago. Still, you can load and execute programs, set breakpoints, single-step, etc.

The program is distributed as an executable requiring wxWindows 2.4.X to be installed. You can download wxWindows from http://www.wxwindows.org if you don't have it installed already. I have also made a wxWindows .so available on my web page if you prefer one-stop downloading, but please be nice to my web server; it's just an old Mac Centris 650 on a cable modem.

http://wsxyz.dyndns.org/sim65

Enjoy!

p.s. I'm posting from comp.sys.apple2, so don't remove that from newsgroups if you want me to see your reply. Thanks...

## 6250. Holme's Website CDs sent out

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-06 05:41:25 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <51531f251e07e6c1cb726cb2f1551226@news.teranews.com>
Source record: 18163

I have sent out the Holme's Website CDs today. I had a lot of trouble with it too, seems like my burner isn't working anymore. I'll have to figure out why. I found another computer though and got them going.

International should get them within a week.
Domestic, maybe 4 days or so.

Don't forget there is probably a Christmas rush going on at the post office now, but I still want to hear from you if you haven't gotten anything in a week.

If anyone else wants a copy of the Holme's Website CDs, send paypal payment for $10 to j70141@hotmail.com
The CDs contain thousands of games and programs for the Atari. An emulator, and all the ROMs necessary to make it work.

# 6251. Atari 1027 print head

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-06 14:23:10 UTC
From: Jeff Stimson <jstimson@rogers.com>
Message-ID: <iDlAb.132840$ZmO.89635@news01.bloor.is.net.cable.rogers.com>
Source record: 18164

Alrighty then. I received a 'brand new' Atari 1027 printer and was somewhat excited to see that it was never used. Packing tape and material was still on the printer.

I hooked it up, turned it on, and proceeded to try a test print.

Much to my surprise, as soon as it started to print the character wheel literally flew apart. All of the rubber letters seperated from each other and came off the wheel. Taking a closer look at the print head and it looks like the rubber deteriorated badly over the last 20 years of storage.

Are there any replacement print heads available for this machine? And if so, will they have the same problem?

TIA

>Kwanzaa. You bastard.

Wrong! Christmas is not a religious only event. Where I live we have
selebrated this event long before christianity came here (around year
1000). The Swedish word for christmas is still the older "jul" and Santa
Claus goes under the name "jul-tomte". The "tomte" is a clearly non/pre
christian folk tradition being.

I would say the same is basically valid for all Germanic countries and
possibly also the Brittish Isles. Don't know about about the former Roman
empire, though...

I talked the matter of Ramadan over with a Persian guy the other day.
Apperently he does not celebrate Ramadan as he is not a performing muslim.

Incidently people who write/say stupid things are in Swedish often called
a "tomte", often with the the christian influenced word "djï¿½vla"
(devil/bastard) put in front. Makes me wonder if you could be called a
"djï¿½vla tomte" :-)

Yes. Once Amiga and Atari were well nigh unseperable!
Until you pulled the joystick cord so you could plug up your Trak-ball that is. This is an auction for the Amiga Company produced joystick - called Power-Stick. The Amiga company went on to produce technology behind the Amiga computer so this joystick for Atari computers (and VCS) is of some mild historical note (i almost said hysterical)...

Cross-posted to: alt.folklore.computers,comp.sys.sinclair,comp.sys.tandy,comp.sys.ti,comp.sys.atari.8bit,comp.sys.apple2,comp.sys.cbm,comp.lang.basic.misc

The full text of a trilogy of classic computer books are now available at AtariArchives.org: BASIC Computer Games (published 1978,) More BASIC Computer Games (1978), and Big Computer Games (1984.)

http://www.atariarchives.org/basicgames/
http://www.atariarchives.org/morebasicgames/
http://www.atariarchives.org/bigcomputergames/

Edited by David Ahl of Creative Computing Magazine, the books feature type-in BASIC games, including such classics as Animal, Blackbox, Eliza, Hammurabi, Lunar LEM Rocket, Mugwump, and Hunt the Wumpus. Big Computer Games also includes Rollercoaster, a unique computer-operated videodisc adventure game for the Apple ][ computer.

The two earlier books feature illustrations by George Beker, which will be instantly recognizable by anyone who read these books or Creative Computing magazine 20 or more years ago.

The books are available with the permission of David Ahl. With this announcement, AtariArchives.org has reached the milestone of making 25 classic computer books available on the Web.

# 6255. xs4all - ftp problems.

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-07 02:02:30 UTC
From: Timothy Stark <sword7nospam@speakeasy.org>
Message-ID: <1bCdnZKYKr-qF0-iRTvUqQ@speakeasy.net>
Source record: 18168

Hello folks,

I am new to this. I was looking for some atari archives and finally found that - atari.xs4all.nl.
I tried some ftp clients but many did not work. Until I noticed that ftp server does not support PASV mode when I tried use 'ncftp' (Linix/Unix ftp client). Ncftp automatically dropped back to PORT mode after login and told me that. I was able download some files by using ncftp client.

I was tried my cuteftp pro for XP and it did not work. Since I noticed that ftp server only supports PORT mode, not PASV mode. I set xs4all's ftp settings to only use PORT mode. Now I was able download or list files with my cuteftp pro client on Windows XP.

Thank you!
Tim Stark

# 6256. wierd facination with 8bit atari's

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-07 02:25:59 UTC
From: kev <kevin@kevin.net>
Message-ID: <gb35tvcpd1f60g14fvkugv8vgd6t2kh9ii@4ax.com>
Source record: 18169

I've had a lot of systems over the years, my first was an atari 400, then a 800xl, 130xe after that a NES, Turbografx16, Amiga 1000, 500, 2000 Atari Jaguar, and lynx also an atari 520st plus all sorts of ibm comp from the 486 on up to now. Anyway, for some reason the only system I really have fond memories of is the atari series (8bit). they seem to be stuck in my brain somewhere. Something about those machines the way they looked and even their capabilities while very primitive by our standards even 10 years ago they were much more impressive than things I see today (for example star raiders in 1980, or the ROBOTCES demo).

Do you feel the same way? I have a theory that since atari really never made a sequel to the atari 800, we just kind of never "let go". The Atari ST was a different beast altogether and while the Amiga was definetly created with the same spirit hardware wise it's OS was not like the 8-bit at all and it was very expensive.

Source record: 18170

I've had a lot of systems over the years too.
(and many are still working or packed in boxes)
My first computer was an Atari 400 with a cassette drive.
God I despised that keyboard! What's the technical term for that? crappy?
bubble-something-or-another?
And the cassette drive, don't get me started.
Whenever I loaded a program, I'd leave the room and ensure all was quiet.
If you coughed or made a loud noise, you got some sort of "bus error" and it
would fail.
I was a kid then, and the only bus I knew was the kind you rode on to get to
school.

I enjoy loading up programs I wrote in the 1980's and looking through them.
I was anal enough to have a lot of REM statements that said when I wrote
what and how it all worked.

When I look back, I realize I knew quite a bit for being just a kid in his
early teens.

Fascination, yes.

I have very much the same feelings. I started with a Vic-20 though and bought a C64. Everybody did that here in Norway at the time. I then saw a store having the Atari 800 stuck in the back and asked about it. They showed it to me and I was hooked. Atari 800 running Star Raiders. WOW, I sold my C64's and bought it (Cost was 16.000,-NOK, but I got it for about 8.000,-NOK, which is about 1000 USD)

Atari rules!

I also find the Atari 8's to be my favorite too. I actually collect
Atari/Commodore gear. I also like the XE and ST/TT line. The gray cases
are the best IMHO!

Hello folks..

Just to mention that the schematics for my Atari-to-PC Joystick Interface
are back online. This device lets you connect your classic Atari sticks to
the PC through the game port. Then you can use them on your favorite
emulator (if you dare to use one instead of playing on a real Atari :) ).
It works with any emulator support the standard ugly PC joysticks...

The link is :

They are all getting that old. They get mushy. I have a good one or two I was going to make a silicon mold to try to make new ones, but with the proliferation of inkjet and the decline in users, I never got started.

For replacements(I don't know the condition) you might try Best Electronics in California. Also for the ink pads.

07 Dec 2003:
I have 4 new products ready:
http://www.a8maestro.com/sites/mtgcat/mtgcat.htm.

For the Atari 8 bit computers:
an audio/video breakout box using the monitor jack:
http://www.a8maestro.com/sites/mtgcat/prodhtml/a8avbob.htm.

For the Atari Jaguar game system:
an audio/video breakout box using the video connector:
http://www.a8maestro.com/sites/mtgcat/prodhtml/jagavbob.htm.
the parts kit and instructions on a pc/st game transfer system:
http://www.a8maestro.com/sites/mtgcat/prodhtml/jagbjlm.htm.
the adapter to connect the computer to the jaguar:
http://www.a8maestro.com/sites/mtgcat/prodhtml/jagbjla.htm.

These 4 adverts are pictures about 150K in size each.

For inquiries and questions email mtg2003 at a8maestro.com
(mtg2004 in 2004)

Payment is check or money order, cash, or paypal in extreme
circumstances.

Thanks,

Rick D.

I started on the 800, but I currently have a 130XE set up and ready
to go any time I feel nostolgic, all I have to do is turn it on....

In around 1990, a friend from college was experimenting with laser
light shows. We met in college when a discussion turned to Atari
computers, we both had one, and enjoyed it...

Anyway, he wanted to hook his Atari up to control the mirrors
for his light show. He already had an IBM with a program to do
that, but wanted to try to use his Atari. Using Action! I put together
a frame editor that include a driver for outputting data to the joystick
ports. I forget the details, but it turned out I could only send 4 bits
at a time, so he added a shift register to his amplifer allowing for
8 bit resolution. Considering it could only do a single frame (a still
image, a word, a picture, whatever, but no animation) it worked well.

I did a quite a bit of programming in BASIC, but when I found Action!
I never looked back. Too bad that was toward the end of my 'interest'
in writing programs for an extinct platform....

Have any of you played a Windows-like Solitaire game on the Atari?

Here's an unsolicited review:
http://www.geocities.com/flynnwins/ocgs/issue10/newatari.html
"If you enjoy Solitaire, then I suggest you have a look at this game.
There is no better version available for the Atari."

very interesting article. it seems I am not the only one who still
has a special feeling about these machines. One thing I noticed
was they mention MYDOS is available on a cartridge and that it must
be removed when the atari is on, while I was always a Spartados man, I
do remember using a special program to "back up" cartridges - it
required you to actually insert and remove the cartrige while the
computer was on too and this would often crash the machine.

I knew someone who ran a lazer light show here in connecticut back in
the early 90's but he used amiga computers to control the display at a
local planetarium From what I remember (those days are a bit hazy) it
was a fairly simple program.

I haven't had much experience with them, but I did see a demonstration
where it may have crashed about 1 in 10 times...

> I knew someone who ran a lazer light show here in connecticut back in

I know mine was a fairly simple program too, but the IBM program was
the full blown deal, professional grade. I went out on a couple gigs with
him, one was a total disaster, (the house power circuits wouldn't handle
it), and the other was so-so. He had the tools, but lacked the artistic
flair for the job! I've seen a planetarium show, it was a far cry better
than I've seen my friend produce. They seemed to have it all on tape,
the music and the commands....

Hi,

Sorry for the problems on the FTP server.

I thought I did post an update here about it. Because I had some troubles
lately with my network overhere and broadband connection I did replace some
thing.
My FTP server was running is PASV before. Now I put a router here and
configured it to use the normal port 20&21.
Due to this change people need now to connect without the PASV option.

Let me know about any other problems.

Oh do grow up. Apart from being wrong to begin with (christmas was around before Christians hijacked it as a date), did he say he won't sell to non-christians? Nope, didn't think so.

## 6271. "Tweek"

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-08 12:45:35 UTC
From: llppwhite@aol.comnsp
Message-ID: <20031208074535.07958.00000400@mb-m16.aol.com>
Source record: 18184

I guess my quest for the perfect video display goes on. As mentioned previously the new cable really made a difference. But I still could see color shift if I moved the cable where it plugged into my 130XE. Since the cable is quite new, I could see the contact lines on the cable contacts. Hmm... not a lot of contact. So I got out the (clear) "Tweek" contact enhancer and lightly coated all the contacts on the plug. When I plugged video cable back in, I noticed that it slid in much easier. And no more color shift if the plug gets jostled.

I don't *think* that Tweek products are still sold, but similar products are available. Has anyone else had any experience with these products? I am aware that there has been a lot of debate as to the value of these, but my experiences have been good.
Larry

basically how the Amiga one worked is you came up with different
"routines" (can't remember what they were called) and you could
combine the routines (which were animations still images etc..) or to
make new ones you just add your own images or animated routines, the
animations were simple with different paths you could choose from and
it was all in 2D. I was never too impressed with the laser shows
(they required a lot of "outside" stimulation to make them
interesting) I remember taking a girl to one of those shows and she
looked at me like I was total freak when it was over (I think it was
called Laser floyd). At any rate it didnt run from a tape, it was in
real-time from the Amiga 3000.

wow, 1000 bucks for an 800, it's amazing when I think about all the
money I spent on PC'sr the years.. ironically I spend a lot less now
as an adult then I did when I was a kid. My first atari the A400 was
almost 400 bucks, within two years I had upgraded it to 32k then 48k
added a GTIA chip and a BKEY keyboard, so I would say it cost close
to 700 USD the time I was done. The other atari's I had 800xl and
130xe were considerably cheaper, Im pretty sure the 130xe cost around
140 bucks. I wonder how much these systems are worth today?

Funny, almost the same story here....

Started with an (~$400) Atari 400 and a 410 cassette, upgraded the keyboard, memory and added an 810 disk drive. Later on when I purchased a 1050 drive, they threw an 800xl in for free!

Perdy.

While I have to confess that I'm an 8bit switcheroo (Apple][, Atari8,
C64 and some Japanese 6809/Z80 boxen), I just love the way Atari8 slices
the video beam and splices it back together... it's truly one of a kind.
Amiga does it too of course, but it lacks char-mapped mode, and hardware
banging is deemed tasteless there (wonderful OS, but still).

I'm not familar with Tweak product but would like to try it after
your glowing account of it, remember where you got it? As to
contact cleaners in general they all get a thumbs up from me even
though with each can purchased at 5 year intervals or so I never
seem to get the same stuff twice and that leads to 'I don't like
this new stuff' for a few weeks. Eventually I come around and
even forget why I liked the old stuff better. Some go on as foam,
some dry to nothing while other leave some kind of oil behind,
yet they all seem to improve connections quite well. I would
love to know why too.

I once brought a new to me 1050 into my line up as a replacement
for the drive I just plain wore out. But I soon developed an odd
situation where the drive (D2:) wouldn't respond at times, weird
boot noises with Black Box system and even access to D1: got funky
at times near the end. Two drops of cleaner on the 'new' drive's
selector switches and the system is still bulletproof many years
later. Minor miracle stuff for sure.

Hi Lee-
Yes, I remember -- a small bottle came with my PC Ditto II board that went inside my Atari ST. So I didn't buy the Tweek, but at least I've still got the bottle (and not the ST :-) You can find quite a bit of info about this line of products by Googling "Tweek", including the theories as to why it is supposed to work. You are probably going to need to Google "Contact Enhancer" But if you have a cleaner that leaves an oily residue, you likely have much of the effect (IMO).
Good to hear from you!
Larry

Since Colussus Chess 4.0 is said to the best game on the C64, I would assume the Atari version was equally strong. On the 64, there were later chess games including a cartridge based one which apparently wasn't quite as good, but for obvious reasons I don't know how the Atari games software market looked like after 1985/86.

Unfortunately I'm much better at administrating chess than playing it, so I can't tell which is stronger than another.

I believe I have that game. And yes, it rules! Nicest looking, fastest
card game >I've< ever played on the Atari (not that I play much ;) )

I'd like to one day write, or see written, a very fast Mah Jongg Solitaire
(aka "Shanghai") game for the Atari.

The best I've seen so far is MyJong, but it's pretty darned slow.
It's a little blocky and low-color for my tast, too. :^(

Gameplay-wise, though... top-notch!

What language do you use? Action! is a pretty robust language, that
allows you to get ML speed.

I did Mah Jong once, I had only seen a Windows version for about
15 minutes, and went and wrote 'something like it' for the Atari. Due to a
friend wanting some source code recently, I happened to try it out the other
day and noticed my version was a little more permissive. Any fully visible
tile was playable, instead of just the edge tiles....

Although that may have been a design decision back then, to make it easier
for little kids. With a little self-discipline, a player could still follow the
normal rules of play!

You'd have to check to be sure, but I think Video 61 still offers it for sale:
http://members.tcq.net/video61/compnew.html
A.K.A www.atarisales.com

(The friend that wanted the source code to a few of my games was
Lance, the owner of Video 61.... ;-)

I went to your site, are you still working on Cat5Walk?

Hello Daniel, German,

Nope, Kyan Pascal was a Pascal compiler written for Atari 8-bit computers. I had the program many, many years ago, and it helped me teach Pascal to one of my homebound students. I gave it away in 1999 and I doubt that it ever became popular enough for someone to make an .ATR out of it.

Take care.

Alan

I seem to remember quite a while back that someone calling themselves Charles Marslett (unless they were using a psuedonym/alias) that used to frequent the atari google newsgroups

I was just wondering if he (if that was his real name) is the smae Marslett that was responsible for coding the Atari xe o.s (and I assume the xl o.s as well)

I say that because when I was still frequently using my 8bit setup (i havent used it in a few years- but I still have it and wont sell any of it) one of my 8bit setups was a 130xe with Multi o.s's in , i.e a hacked version of Omnimon (by a John Sosta), Something similar to ultraspeed o/s... this one was called warp speed os, and also ultimon o.s (similar to ominmon) as well as the standard xe os

When i was scanning through the xe o.s (I cant rememeber the exact location or region but I think it was either after d5xxH or after d8xxH if you looked at memory using the ascii/atascii/text option the name 'Marslett' appears, once or twice, i cant remember... I did this using both omnimon and ultimon

Now assuming that there's very little difference between the original xe o.s (less the version that had the patch to self test mem. beyond 64k- this version wasnt officially released by atari as I understand it)and xl o.s I would assume that the above occurance also happens in the xl o.s

This actually reminds me of the famous story above dave staugas (ex atari staffer) who managed to get a love message incorporated into the st o.s roms (like the marslett example .. it shows up as standard 68000 or 6502 ascii/atascii/text code

Right off the top of my head I think you are probably mistaken
about the OS you were looking at when you saw Marslett's name
in the code. The Bob Puff US+ OS had that as Marslett rewrote
some of the 'math pack' on that particular OS only. Prior to
that he wrote MyDOS and then Bob Puff joined on as co-author
and debugger to release MyDOS 4.50.

As to any official relationship between Marslett and Atari
corporation I'm drawing a blank and would love to hear more
about it.

I would love to use my WICO bat-handle joystick on my PC.
I've seen the conversion diagrams, but find them very difficult to
interpret.
I'm a very technical person who works as a network engineer. I've done that
sort
of work back in college (building circuit boards) too.

Anyway, maybe somebody should take up building & selling them!
If anybody wants to make one & sell it, I'd be interested.

I think there were 3 main Pascals for the A8.
Kyan, Draper and CLSN.
I think I tried all 3 and CLSN was the better of the three.
CLSN was a commercial one, the other 2 free, I think.
CLSN requires a 130xe to run, but the code it generates
will run on a 64k machine.
Video 61, B&C or Best may still sell CLSN, check the
vendor list.

> 64k- this version wasnt officially released by atari as I understand
> it)and xl o.s I would assume that the above occurance also happens in
> the xl o.s

There's no such string in the Atari XL Os, neither in the OsB ROM.

```
$ cat ../../Atari/roms/atariosb.rom | fgrep -i ett
$ cat ../../Atari/roms/atarixl.rom | fgrep -i ett
$ cat ../../Atari/roms/atarixl.rom | fgrep -i BOOT
Binary file (standard input) matches
```

The last example searches for "BOOT ERROR", which is indeed found.

Greetings,
Thomas

Well, interesting proposition...

I can build one interface and send it to you... Contact me if you are interested (fernandes@multitel.be,fernandes_emmanuel@hotmail.com).

Eventhough I publish these diagrams and my schematics in the "public domain", it doesn't mean somebody can build them and earn money with that. Of course somebody can build one interface and ask money just for the assembly and soldering work, but nothing more. Nobody interested in some kind of "mass production" should go further without contacting me before...

Bye,

Emmanuel Fernandes

I believe the XL OS was internally coded at Atari and Marslett never worked for them. Much of the XL OS was taken from the 400/800 OS which was written outside of Atari, for instance the floating point routines were written by Bill Wilkinson.

Marslett was tied to MyDOS and in all likelyhood wrote the high speed disk access for it. My guess would be someone included his disk routines in their OS and gave him credit. I would check the bank switching flags to make sure you aren't looking a an OS copied into RAM and then patched for high speed disk access.

Charles also wrote an utility to transfer 256 byte sector Atari disks to the IBM. IIRC: He moved from the Atari to writing IBM clone BIOS.

## 6299. accelerated 8bit

Newsgroup: comp.sys.atari.8bit

a long time ago (late 80's early 90's) I remember reading about a project to upgrade the 8bit atari's with a new faster cpu and a compatible OS. It was an upgrade on the existing OS (I believe) there was even talk of an ST emulator for this new hybrid. Did it ever materialize and does anyone remember what it was called?

btw this was a third party idea, not an atari product.

kvn

> ...a long time ago (late 80's early 90's) I remember reading about a project to upgrade the 8bit atari's with a new faster cpu and a compatible OS. <

There have been at least two articles written about this:
* Atari Classics had an article in the Sept/Oct 1994 issue.
* AIM (IIRC) had an article by the guy that did the Turbo 816 project. He presented this in a discussion group at the Chicago Atari fest in 1991.
* There have been other projects that have gotten a 65816 working in the Atari, but AFAIK, no one has claimed to have successfully raised the clock speed.

Currently, the only way to run the "Atari 8-bit" faster is an emulator. A fast Pentium or Athlon will run some stuff at 30 times faster than the original. Counting the disk (lack of) overhead, it could be closer to 50 times. IMO, the most likely stand-alone hardware that could run A8 stuff faster than 1.87 MHz is the Commodore One with a (maybe, possibly, yet to be developed) Atari "personality module". That still might happen. Is that an emulator? It gets a little blurry, but its cpu is a 65816 or a very close friend.
Larry

Yeah, I prefer Action! for speed. Though I'm still a BASIC loser,
so I've done lots in TurboBASIC XL.

'course, haven't done much in a long time (see below)

Heh, yeah, Gem Drop was like that. Saw "Magical Drop III" in the arcade,
said "hey, I could do that," and wrote it.

Then I finally PLAYED the arcade game myself, and I realized I had to
tweak my game to have more 'correct' rules. ;)

<snip>
> I went to your site, are you still working on Cat5Walk?

Hum... I should. ;^) I need to find the time and patience. :)

Been having fun doing cellphone games recently, though.
I wanna maybe pick the brains of some of the Atari 8-bit demoscene coders
out there to learn some of the cooler 'tricks of the trade.'

At least to amuse myself, it'd be cool to see a fast rotozoom on a phone. :)
(The phone I have for dev is quite slow, frankly. :^( )

Hmm,
also quite good (in my eyes) are the chess programs:
- Colossus 3.0 (higher ELO rate than 4.0, but no 3D!)
- Chess 7.0 by Odesta
- Chessmaster 2000

And if you are a collector of chess programs also look for;
- My-Chess (Datamost)
- Sargon Chess (Hayden-Software)
- Sargon-Chess 2 (Hayden Software)
- Sargon Chess 3 (Hayden Software)
- Parker Chess (by Parker of course)
- Chess by Atari
- Querg-Chess and Querg-Negation (PD by ???)
- Basic-Chess (PD from Compute mag.!)
- Killer-Chess (from Antic or Analog)
- probably a few more programs...

greetings, Andreas.

Back some time ago, (10 years?) there was FTe that did come out with the Sweet16 board 65816 chip, I when to the TAF meeting and seen it working with there SpartaDOS version.

I did buy one before it was released, then FTe was no where to be found, the product never made to the production line.

What Larry said.

The major problem is the Atari GTIA chip which controls all the graphic display and sync signals. If the system clock is changed by even a few percent, the sync signals fail to function and the screen rolls/warps.

I have run a system up to ~2.05 mHz with an adjustable sync circuit I built, but that is the absolute limit of the existing chips. Everything is wrong at that speed, screen is scruched up with some garbage on the border, sounds/tones are off, SIO is out of whack, you lose color since the color burst signal is off.

There have been 65816 mods from two different people, Dataque and FTE. The problem with them<IMHO> is they never got a killer application that made them a 'must have.' That is still the problem today. If you find one of the old processor upgrades you will still be running at a system clock speed of 1.79 mHz and w/o a program specifically written for the 65816, it will execute the same speed as an existing 6502 system.

Most of this stuff could be fixed in theory by doing things like automatically switching clock speeds during display. The amount of extra wires under the hood to do the fixing starts going beyond what an average Joe can do.

>I did buy one before it was released, then FTe was no where to be found,
>the product never made to the production line.

that explains it then. at the time I thought the whole idea seemed a
bit impractical, but now it sounds like it would have been cool.
Especially since it would have emulated an ST (in low res) now that
would have been something. I bought an Amiga 500 around this time
and sold my 1050's, which I regret now, because the only "old school"
computer I wish I could boot up once in a while is my 400 or 130xe.

interesting. I hate to bring up the amiga, but it also had
co-processors that were designed to run at a certain clockspeed,
however, if you added an cpu acelerator the other chips still ran at
the old speed. I seem to remember a special version of a really cool
(at the time) terminal program called puf or something like that, it
would run with one of the upgrades we are talking about. I wonder how
they managed the display problem with that.

All the SA adventures were available for the Atari. I used to see Scott in the early 80's in Central Florida. He used to live in Longwood, FL. You can still go to his website and download adventures for the PC. IMO I think Scott's adventure games were GREAT! Say YOHO!

I don't know the "official" rating of those 8-bit programs, but
"Chessmaster" was always pretty powerful and my favorite.

On a side note: I once conducted my own computer chess competition (yeah,
really exciting stuff). I had a bunch of computer systems all playing
eachother in chess. I had a few ataris (8-bit and 2600), a mac, an old ibm
PC, etc...I would start 2 games, then just input one computer's move as MY
MOVE on the 2nd computer...and so forth.....I got bored after moderating
this for a while...as you can imagine. The results? Nah....it was too long
ago (80's) and I don't recall who the champ was.

Those joysticks were so much easier to use than the bulky and slow
'potentiometer' joysticks of now days. Especially in fast action
arcade-like games.

I have always said that my favorite computer days were the 8-bit
ones. I loved that era. It was probably because there was a serge
to improve on the programs and not the computers as it is today.
There were no graphic/program teams, but only one author sitting
at a desk. The programs were not as flashy as there are today, but
they did have ALOT of gameplay. That is why I still have my 8-bits
along with tons of program disks/carts.

>I kind of find it hard to believe...

At the time alot of 8bit atari users didn't feel the ST was a proper nxt gen atari. St users pointed out the fact that there was an atari 8bit emulator st (therefore it could run 8bit software+st etc) anyway just before the accelerator was coming out one of the projects for it was low-res st emulator, which was like a slap in the face to the St users... I dont think one was ever made.

People got touchy about emulators back then. For years people said an amiga could never be emulated and when UAE came out one of the first ports was to the amiga?? I suppose people figured that if you could emulate an 8bit with an st, the ST was defenitly superior.

I had a discussion with somebody (I believe it was Mike Hohman) in the early 90's about the possibility of an engineer doing a programmable chip (not sure what the term would be.. Programmable Logic Array?) that would incorporate the functionality of the Atari custom chips into one package. The idea of course was to build a version of the custom IC's that could be clocked up quite a bit and then used in conjunction with the '816, and at one point he had spoken to an engineer who claimed that between chip specs and reverse engineering he could do it. Of course nothing came of this, but it does sound cool. One more for the vaporware/rumor mill!

Oh yeah, and I'm one of the guys who also landed a Sweet 16.. too bad it wasn't like the AdSpeed: double clocked internally with a built in cache. ;)

# 6320. Atari 400/800 downloads

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-13 17:18:43 UTC
From: Tom Miller <tlgalenson@chatnfiles.com>
Message-ID: <vtmid24fp4pbb9@corp.supernews.com>
Source record: 18134

A Motherlode of ms-dos files
Drop in and sit a while!

The Chatnfiles bbs ( www.chatnfiles.com ) is mainly known for having Chat and having Files. I offer a large (160,000+) and old files download collection. My oldest files date back to around or before 1988. I have both Carousel2 collection (1988) and the ms-dos portion of the Simtel ftpsite (on cd-rom) from about 1994.

The Carousel2 includes about 17,000 files. The target operating systems include: ms-dos, windows 2.11/3.x, Mackintosh (system 6?), OS/2,

Atari 400/800,

Comodore
64/128(?) and the Amiga. It also has about 5 different sub-directories with graphical files including both Gif and non-Gif formats.

The Simtel collection offers up about 10,000 ms-dos programs and files from on or before 1994. On a mailing list, it (and/or the Carousel2) were referred to as "the motherlode"....

I have a shareware collection called "Bobs Hall of Fame" that actually has Files for the Ibm System 3/A400 on it as well as more typical Ms-dos files...

I have a number of the Pier Shareware collections, Night Owl collections, Shareware Vault plus a number of singletons like Project Guttenberg, Nasa Space and Astronomy, Alan Appleton's BBS cd-rom, Best Windows games, Hot this that or the other.

You can use Google to search the local file area. Or you can simply browse the directories. The downside is there are no easy to use tools in the www server world to allow me to easily provide keyword access to the file collection. I am in the process of writing a script that will attempt to produce a "files.htm" page that includes file descriptions for each sub-directory that Google will read and produce a less garbled index of.

The website is running on a cpu/bandwidth throttle so it will not interfere with the other websites when lots of people are downloading. So it doesn't matter if 200 downloaders showup at once. They will get good service and so will the other sites.

The Chat system is running a perl script called Eileen, v2.1
which is derived from a popular chat script called Everychat.
It has multiple rooms and provides about 30 actions or
"emoticons."

The rest of the site is your basic personal website. I am
looking at upgrading to a product called AspPortal but the files
download indexing issue would remain. Drop on by.

yeah, it would be fun to have....
but it would probably cost too much.
If you've built it before, then I suppose you know how much the parts cost
and how much time it takes to make.
I figured between time/labor, parts, shipping, I'd be spending too much for
just a "neat toy". OK, a really neat toy.

Bob Wooley has posted about what he considers a viable method for doing it.
IIRC, a programable logic device that switches to lower clock speed when any
hardware is addressed or 6502 is halted, replace all RAM with a CMOS static
ram, that kind of stuff.

For normal human beings, such as myself, the 200-300 connection and
desoldering chips necessary to perform this kind of surgery is real iffy.

Don't forget the main problem: After all this is done, what do you end up
with? A computer that plays Pac Man at the same exact speed with the same
exact display. There is no killer application that will enable you to do
anything you can't do with a stock Atari other then the MAE assembler which
will let you write your own 65816 code.

yes, good point. Of course at the time this was originally discussed
there were plans for certain software packages to be ported over to
this new psuedo-platform. One piece of software that I seem to
remember was already running on the turbo-8bit was a version of a
terminal program called puff or something like that. I remember using
the standard 8-bit version and marvelling at the fact it allowed you
to play breakout while you downloaded your software from bbs's
At that point there was very little true commercial software for the
8bit and most of the quality software was from the thriving shareware
community so it did seem possible there would be similar support for a
new psuedo-8bit platform.

does anyone remember this old terminal program for the atari?
it allowed you to download in xmodem and it had the unique feature of
letting two disk o link users talk to each other while they were
downloading. It al allowed you to point and click with joystick and
sported "windows" that popped up and collasped.

my question is this, it was the first time I had ever
seen a point and click interface on a home computer (I realise xerox
was doing this in a lab someplace) and it came out in 79/80'sh. Was
this the first "desktop" interface for home computer?

Could be programable gate arrays too.

It may have even been a 'she'. I seem to recall there was something like a mysterious housewife in Oregon that did a C64 custom chip set in a PLA.

I looked at PLAs and there are amazing things they are doing with them. There are even PD 6502 designs you can execute in PLAs. I think Western Design Center may sell some code to make a 65816 in a PLA.

The programmers for PLAs are beyond a casual user could afford or would spend. I don't know if they suffer from the same problems I found with modern micros/DSPs in that I couldn't even get a supplier to talk to me or return my calls. About the only parts available were "Not recommended for new designs", 8048 derivatives, crap that was obsolete 10 years ago.

Probably Bob Puff's Bobterm. I think Dataque came out with a few apps but it
was mostly stuff people didn't use.
> At that point there was very little true commercial software for the

Mike at FTE did have a decent plan, just a complete lack of horsepower and
resources. He figured he could do things like get some OSS languages
rewritten in 65816 code. IIRC: Unfortunately 'good' source code did not come
with the rights to the languages<resources> and the -only- guy he had
helping him on a regular basis was Kyle Dain<horsepower>. I think
Williams<aka Alfred?> got the source to Action! from Mike, but nothing came
of it.

Hi Richard-
> Don't forget the main problem: After all this is done, what do you end up with? A computer that plays Pac Man at the same exact speed with the same exact display. There is no killer application that will enable you to do anything you can't do with a stock Atari other then the MAE assembler which will let you write your own 65816 code. <

Yes, exactly! There are very few A8 applications that are compute-bound on our current machines. The one that most readily comes to mind is Super ARC/UnARC. But do you really need Arc when you can Zip it, RAR it, Stuffit, etc.,etc.?

Very few games are in this "cpu camp," but those that manipulate large object groups or large sized objects can have problems. Dark Caverns and Gauntlet come to mind as the monsters truely "crawl" when large groups of them are swarming.

Lots of programs are language-bound. Bill Wilkinson wrote a very good article about this in his wonderful "Insight ATARI" column. Optimizing compilers can go a long way to helping that. (AFAIK, only one Basic compiler for the A8 that claimed to be "optimizing" was ever written for the A8 -- Advan Basic.) But the evolution of Basic on the Atari is a good example of what can be done -- we started with 8K Atari Basic, and ended up with Turbo Basic and it's compiler (with lots of other improvements along the way.)

Quite a few progs. are disk drive-bound. Better drives, hard drives, ram drives, APE -- all can make a big difference.

Other progs are memory bound -- where having lots of contiguous memory would help -- sort of the "ultimate ram disk". (Oops -- we need languages and an O/S that could use the extra memory, don't we...) Still, a reliable 65816 and memory management system would help this a lot.

But at the end of the day, no really big "breakthrough" is likely to happen. Best to find work-arounds, and take advantage of PC technology wherever possible.

Last, I guess, I should mention that there was a *real* 65816 custom Atari machine that was sold mainly for cable TV operators. I *saw* this at the "World of Atari" in 1998. It was in a small PC case -- about the size of a PS2 case. Had a 65816, a built-in Black Box, 3-1/2" drive, and had the ability to run at 3.52 (?) MHz when running in the 65816 mode outside of the normal 64K. I think it had a second display chip to allow running at the faster clock speed. Really nice, from what I couuld see. Really worked, too.

I am able to use the old joysticks but I used a keyboard encoder ( IPAC )
which took a little wiring but not too much. I also had to put it in a box
w/ some 9 pin DSUB connectors. Works very well with all emulators as long
as they support keyboard emulation of the joystick(s).

Don't know of a service like that (other than ATR files!), but I bought an SIO2PC cable from here. You can also get a 1050-PC cable if you want to connect the 1050 direct to the PC.

http://j131atari.webpark.pl/

I wouldn't try writing files to a 5.25" disk using your PC drive. This can work, but not reliably in my experience.

Thanks,

Mark

I am sorry I missed meeting you there, Bill. I did not know you had an interest in the Amiga scene. I guess you are well aware that two of your SDL games, CircusLinux and MadBomber, have been ported to MorphOS versions. MorphOS being the software portion of the Pegasos PPC-based computer solution created by former Amiga developers, now marketed by Genesi. I have a Pegasos and have installed both of those, very slick.

Now Jeri did indeed show the Commodore One board at AmiWest, unfortunately we did not see any demo. Some of these projects just seem to linger indefinitely, I wish people would bring something to market once in a while.

Another great guest at Amiwest was John Harris, formerly of Sierra Online, who authored Jawbreaker. John told me he recently unearthed an early version of Jawbreaker that had PacMan-style graphics. The then-teenaged John originally wrote a pretty straight clone, but switched things around when Sierra's lawyers explained Sierra couldn't possibly sell that. I have been meaning to write John to see if he would release an ATR...

# 6339. ATARI 130XE - Memory problems

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-14 17:37:35 UTC
From: quadro <quadro@tiscalinet.it>
Message-ID: <3FDC9FDF.9C8A9AC8@tiscalinet.it>
Source record: 18052

Hello folks

Unfortunately, today (after 5 days power-off) my Atari 130XE show me
memory problems
At the boot the computer jump to the Memory Test....always!!
No Basic or Self-Test screen, but only and continually Memory Test.

The screen appair:

RAM
G R G R G R G R G R G R G R G R
R R R R G G R R R R R R R R R R
G R G R G R G R

G = GREEN SQUARE
R = RED SQUARE

So, i get off the case to check the memory chips, they are : MT 4264-20
(20=200ns)
or better 8 x MT 4264-20 and 7 x MT 4264-20 + 1 x NEC 8504 RD155 (16
chips in all)

The chips are not hot, but cold (or better lukewarm)...idem for the MMU,
EMMU and FREDDIE chips.

Is possible, that all memory chips (or so) are junk?

Please, help me, i'm very disperate

Thanks in advance
Morris (ITALY)

no, wait. I am sure I don't understand your question.

I did get one of those cables that lets you use your ibm PC as a big 'disk drive' for your atari 8-bit.
That works fine.

If you have another way of wording your request or give a few examples, maybe I can answer your question.....or maybe somebody else can. I'm not entirely sure what it is you're trying to do.

Caverns of Calisto and the early Ultimas were a bit slow too. They were
written using graphic 8 screens with artifacting.

<snip>

I pretty much stopped programming in assembly on my Atari when I got a Tandy
8 mHz 286 clone with a 20 meg hard drive. TASM on a 286 with hard drive was
just so much faster then anything on an Atari. Of course I had SIO2PC for
testing the final code. I'mnot sure what I would do now if I started
programming again, maybe a windows based cross compiler and test the code
with an emulator.

We really needed at least one hardware upgrade from Atari. What Yamaha did
for the display chip in the SNES was ~run it at a high clock rate for the
dot clock and divide it down for the processor. If Atari would have come out
with a GTIA that ran off a ~7 mHz crystal and an ANTIC that could display 80
bytes on a horizontal line, it would have made the system much more useful.

There is something like TEDIT that was written by one of the guys who did
BBK art. It was pretty good, but always defaults to a 2 space
indentation/margin from the left.

Eghads! I thought I was the only one who thinks of things like this. :)

A few years ago, I decided to use emulators and keep it to computers
I've owned (Atari 8-bit, Amiga, and PC). I started off with the Atari
8-bit's Chessmaster 2000 vs. Amiga's Battle Chess, but unfortunately I
lost the first results. I started again this summer and so far, the
Amiga is narrowly leading the Atari; the winner gets to meet the PC in
it's version of Battle Chess.

How do you make your Centris 650 accessible on a cable modem? I thought
that the IP addresses for cable modems are dynamic?

- Mike

From what I've heard talking to a person who's used two different cable
ISPs, it depends on the ISP.

Comcast told me they can allow static IP addresses, but
they prefer not to. If you beg them and get the right
customer support person, they can be talked into it.

Back when it was TCI, I purchase a static address for an additional $5 per
month. Then, ATT took over and assigned all new IP address'. I called them
about my previous static address and they said that they no longer were
offering static address' (but they didn't seem to mind taking my extra $5
per month until I called them about that too.) Then, Comcast took over and
continued ATT's policy.

The ironic part is that from the time that ATT took over until just a week
ago, I had the same "dynamic" address. In other words, since I never turned
my cable modem off, I kept the same address. I ran my web page for all of
that time on the same dynamic address, as though it was a static address,
and I didn't have to ask permission or pay extra.
```

OK, that was then but this is now. A week or so ago, my internet connection stopped working. I followed the problem back to my IP address -or my NAT settings to be more specific. It seems that Comcast reset my IP address around 8am PST, which broke my NAT settings. So, I took my router out of the loop, checked my new IP address, and reconfigured my NATs, and my webpage was working again. The next morning at 8am PST, my IP address changed again. Ugh! I followed the previous steps to get my page working again. Next day, same thing. Shit!

Since then, I haven't restarted my webpage, and guess what? My IP address hasn't changed. I get the feeling that Comcast is trying to stop people from running web servers on their home systems. Can they know if I am doing that? I'm not sure but it looks that way. I'll restart the web server tomorrow and test my theory.

I played Colossus, but din't like it very much.
I still play Sargon III on emulator regularly.
I extracted a binary load file from the boot disk, made it so the
openings disk would be in D2:, changed the blue-white board
to sorta tan-brown.
The Sargon III that I recently downloaded from the site (..... a .cl site.)
wouldn't load an opening no matter where the openings disk was.
i.e. I think I have a better crack of it than is in some archives.

Which brings up a question I asked about a month ago, nobody
said. LARRY RICHARDSON..... (I think that was the name)
had a great site of cheats, solutions, docs, but it is gone, we
need that site (fer instance, I put SCRAM and SARGON III docs
on it.)

A simple scheduled portscan by the ISP on its customer's IP addresses would tell them if common (and even uncommon) ports are being used. It would probably be straightforward for some script wizard to make a script to change the IP if open ports are found.

The way around this is to use one of the dynamic DNS systems around the 'net. DynDNS.org is a great one - just do a search for "dynamic DNS" on your favourite search engine to find others.

Hope that's of use,

Sean

PS Here in Aus, I've had the same IP with our cable provider (Bigpond) for close to 2 years, even though it's officially dynamic. That's even with a move across town and numerous power resets on the cable modem. They frown on people assigning static IPs in their TCP/IP settings, even if it's the same IP which has been distrisbuted via DHCP. And we can't pay for a static IP, not that it's mattered for ages.

Well, seeing how cool the Amiga is, and how similar to the beautiful Atari design it was, I've always wanted one. I haven't found the time to go get one, though. :)

The folks from the Sacramento Amiga club invited my club, the Linux Users' Group of Davis, to have a booth there. Unfortunately, cost was prohibitive, and there was little interest, other than me.

They missed a neat show, though! Cool new hardware these days. :)

Yeah. OTOH, the market is tiny, compared to anything one would make a /real/ profit from, so I'm just glad people are stretching the limits and working on cool things _at_all_. :)

This is exactly how I do it, as you can see from the address of my
web page.

The Centris 650 is running NetBSD and is the connection to the internet
for my home network. It serves web pages and does NAT for the rest of
the computers on the network. It's built-in 10Mbit Ethernet talks to the
cable modem and a 10/100Mbit NuBus card connects to the home network.

However, I'm thinking of replacing it with a Linux PC. I have three
unused PCs lying around, all of which are more powerful than the old
Mac, even though they are worthless pieces of crap by PC standards.

Digressing more, I find that the Centris 650 is much more sturdy and
reliable (and well built) than the Beige G3 desktop next to it, although
their external appearance is almost identical.

I do it via <http://www.no-ip.com/> although I generally am not running a webserver. Usually only access
to filesharing, ssh or Timbuktu when I'm gone. You can download a
program that will run every so often and make certain your IP address is
current with No-IP's system. Currently if you go to buchner.zapto.org
you should get the default web page served up by OS X from my G3
connecting through my router. I suppose I could be like Sheldon and set
up my Quadra 650 as the web server, but the drain on system resources
stays quite low, even when someone's downloading a large file that I set
up be to accessed through http. Usually stays under .2% of processor
time with occasional bumps up to 1%. But it'd probably be generally
safer to run it on the 650...less of a security risk as I'd be running
Mac OS 8.1 on it. But I try to make certain everything stays up to date
on the G3 or the connectivity stays off if there's a long term no-fix...

Now, my IP address may be listed as being dynamic, but it hasn't changed
since my router booted up on 9/30/2003 after a power outage. Road
Runner only seems to change it for me when I've been down for a while
because of something.

------------------------------

Subject: Introduction
```

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---------------------------------------------------------------
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!
--------------------
This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this

list, please do your part in keeping it useful for everyone!

---

```
Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: July 28, 2003

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Does TEDIT work with the XEP80?
I also found KEDIT. Do you know that one?

Thanks

Jochen

Yea, the Centris/Quadra 650 is built like a tank. Have had a few of
them and never had anything wrong with them. Meanwhile, my brother has
had two Beige G3s end up with problems.

So, have to ask...how much did you pay for the 10/100 Nubus ethernet
card or did you find it used and cheap. I remember looking at them long
ago and while I don't remember the price for certain, I do remember that
the last time I looked it was over $200.

Be very careful unsoldering the old ram chips. The traces/pads on the 130XE
are VERY VERY weak and will pull off easily. After you install your sockets
I highly recommend you use a ohm meter and check your work.

> are VERY VERY weak and will pull off easily. After you install your sockets
> I highly recommend you use a ohm meter and check your work.

Another comment on this one: I found myself a while ago in a similar
situation, but with one bad ROM chip as well. The computer was damaged due
to static eletricity (I touched the parallel port in the rear of my XL!)
and more than just the ROM got damaged. The RAM was actually fine. So it
*might* be that - similar to my case - the MMU and the timing/decoding
chips broke. There's IMHO only one way to test this: Exchange them. In my
case I was lucky because I found them socketed in my (early) XL model.
Later models have them soldered in.

And a final word about the self-test:

Don't (!) thrust it. If you see red blocks, the corresponding RAMs are
broken. But if you see green blocks, you know nothing. The self test
does not test all possible RAM addresses, for some addresses it simply
pretends to test (no joke!). This goes for the zero-page, the stack area,
the page 2 (Os variables) and the RAM area under the self test. All these
areas will appear green, even if the RAMs there are broken. No test is
performed...

So long,
Thomas

Thanks a lot mates....very nice infos!!

I think it's not the ROM chip, becouse this afternoon i've tried to power-on the
Atari
and the screen showed READY, but with some strange characters (random "heart"
symbol
around the screen).
Than, i've pressed the RESET key, but the computer (this time) jump to the "Self
Test" without remedy!!.

>....There's IMHO only one way to test this: Exchange them.

Better to order the memory chips (4264 o 4164) from "B & C ComputerVisions"
(www.myatari.com).
They sell: RAM 64K SET (8) XL/XE US$15.00

>....In my case I was lucky because I found them socketed in my (early) XL model.

In my case i am not lucky, becouse my 130XE have 16 chips...all soldered!!

Greetings
Morris (ITALY)

If a DRAM is bad in the *extended bank* of a 130XE, will the machne still boot up normally? I've actually never had a bad ram chip in an Atari, but I've wondered about how the extended 64Kaffects the operation.

Yes, they look for a web server by running scripts and see what response
is sent. They look directly at your IP rather than the DNS reference.

>I'm not sure but it looks that way. I'll restart the web server tomorrow and
>test my theory.
>
>
>

Try a forwarding DNS entry, i.e. goto, fly.to. You will have to pay for
the service but the service and the program you download will
automatically update the DNS entry to your current IP.

If you're cheap, and if you have advanced knowledge, just refuse to send
a response to their web server queries or block requests from their IP..

that's basically what the 800xe was right? (130xe with only 64k ram)
so it stands to reason it would work, is there a way to put more than
128k in the 130xe?

If you run the 65816 at, say, 7.16mhz on all memory accesses and clock down only for the hardware chips, you will run everything much, much faster than a normal Atari. On cartridge games, you need to move the data into a shadow RAM to get a really dramatic improvement. PacMan would definitely fly....

You really don't need new software, but programs that do not use Pokey timers and such will run too fast.

200-300 wires? wimp!! (nawww,,, I hate wires, too)
Nothing to de-solder on a 1200XL, though.

The first 300 developer boards have been built. Jeri continues to
work on squeezing the C64 core into the two FPGA's of the
CommodoreOne/C-One. As soon as the core is ready, then the C-One goes
into distribution.

From: Anthony Ramos
Subject: Micropalooza!!

Ok everybody, I've got some catching up to do on this event, to say the
least. Here's a start:

Planning the event itself:

What: Computer user group Super Summit featuring four live "chip
music" performances.

When: Tuesday, December 30th
User group meet: 1pm - 10pm

Performances: 6pm - 10pm

== WHO ==

Computer Enthusiasts
---------------------
Dave Moorman of Loadstar disk magazine
Jeri Ellsworth (designer of the CommodoreOne)
Fresno Commodore User Group
Upper Peninsula Commodore Home Users Group
Astoria Commodore User Group

Artists
-------
Lineup:
Waxin' Wary: 6pm - 6:45pm
MOS-8: 6:45pm - 7:45pm
gotoXY: 7:45pm - 8:45pm
Seth Sternberger as 8-Bit Weapon: 8:45pm - 10pm

How Much: Four bucks at the door, re-entry with stamp. Computer club
members get a $1 discount with proof of club membership. Open to all
ages.

[snip]

Thanks,
-
A.

Hi,

> If a DRAM is bad in the *extended bank* of a 130XE, will the machne still boot
> up normally?

Yes, but....

Yes in the sense that the Os ROM does not test the extended RAM in any way,
so errors aren't detected in that area.

"But" because it might very well be that Atari used RAM chips of the 128Kx1
organization, which basically means you cannot pull the extended RAM without
also pulling the "regular" one because it's all in one chip (per bit).

Thus, if the extended RAM is bad, so is the regular one because it's all in
one chip anyhow...

So long,
Thomas

Hello,

I had the same problem like you but with the help of a utility called XEX2CAS (available at http://home.planet.nl/~ernest/atarixle.html ) I was able to convert quite a lot of games into .CAS files. There is a quite large archive of games in .XEX format at http://atari.webpark.sk/hry.html . I hope this helps.

Peter

# 6384. Atari 1050 disk drive help needed.

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-16 15:35:12 UTC
From: Bill <bab5@eircom.net>
Message-ID: <aJFDb.1128$HR.3015@news.indigo.ie>
Source record: 17997

I recently was given the atari setupthat my brother had boxed and in his attic who asked my if I wanted it as he was throwing it out, an Atari 800xl, 1010 tape recorder and 1050 disk drive. All the hardware is fine except for the 1050 disk drive, he had taken it apart and never put it back together again.

I was wondering if anybody had a diagram or exploded diagram of the 1050 internals to help me put it back together.

thanks

Bill

About $320, a little depending on the daily exchange rate.

Btw; it is C-One, at least until some deal has been made with Tulip
to use the Commodore brand. I don't know if that is planned to happen
at all though.

Sorry this is off topic, but there is no "atari google newsgroup" (besides the fact that these posts by Marslett are probably dated much earlier than Google ever existed). Google simply contains an archive of historical contents of this newsgroup, among thousands of others.

Hello folks....again me...Morris from Italy.

Just a little info:
B & C ComputerVisions (www.myatari.com), recommend me the following
chips:

RAM 64K SET (8) XL/XE
FREDDIE
MMU - XL/XE / PAL
and in last
GATE ARRAY 130

That one (Gate Array 130), what is it?
It is a MMU, EMMU, PIA or what?

Morris

That cake is not baked yet.

However there is an Atari 8bit emulator for Amiga that might run on
MorphOS:

http://de.aminet.net/aminet/aminet/misc/emu/atari800.readme
http://de.aminet.net/aminet/aminet/misc/emu/atari800.lha

I am too busy to try it lately but maybe over Christmas. If someone
else wants to try it you might need the ROMs from the "xf25.zip"
archive, try here: http://atari.sh.cvut.cz/ftp/emulators/.

Source record: 18010

It was my attempt to make a stand alone Action like editor. It also was designed to work with the E: device
hoping it could work with 80 column drivers. I provided a fast 40 column E: handler, a flicker term like 80
column E: handler, and a graphics 8 type 80 column E: handler that could be used in place of the default OS
one with the program. If I remember correctly, the only thing that really didn't work was the extend memory
drivers. You could also try KASM which supports most of AMAC's features and should be a little faster.
Everything should be available on my page or at the umich site.

Now would be a good time to invest in a soldering-iron-meet-vacuum-pump
contraption (dunno the exact name). For ~30U$D (around here), it worked
wonders when I applied super-video mod to my 800XL and 130XE :).

Some die-hard enthusiasts probably will, but since it is not a
PC replacement, it will not find its buyers among those wanting
to upgrade their 1.4 GHz Pentium 4 system.

hello all,

many thanks for the input..i was thinking of using the pot pins in the joystick port in order to have a dynamic sound related to the hardness of the hit. i want to learn assembly on my 8 bit.. maybey i will. but it looks like i am going to use a standard program for the atari that does drum sounds .. like digi drum or bash.. etc.. i will wire up the keyboard to pads and be done with it. one atari for each drum.. i have so many ataris and i think it will be most able to keep up with me set as i described, one atari per drum.

thanks alot for your input.. Atari 8 bit.. live!

I found KEDIT on your, therefore I was asking. Do you know if KEDIT
works with XEP80, which it, in theory, should?
KEDIT seems quite good, but I just tested shortly in an emulator.
Next year ;-) I will begin my project, so then I will decide on an editor.

# 6408. Antic Linkline and Atari BASIC book AUTOGRAPHED

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-18 05:35:51 UTC
From: puffpuffin@aol.comNOSPAM
Message-ID: <20031218003551.21909.00000833@mb-m19.aol.com>
Source record: 18021

Hi everyone,

I've got some old atari 8-bit stuff to get rid of.

Antic Linkline transferring software for Atari 8-bits & STs
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3646572721&category=182&rd=1

Atari Basic - Faster & Easier Book for 8-bits
Great AUTOGRAPHED book signed to Jim Capparell of Antic Publishing.
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2773915288&category=352
2&rd=1

Thanks for looking.

# 6410. Atari & s-video

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-18 19:53:37 UTC
From: Michael Gale <michael_c_gale@sympatico.ca>
Message-ID: <zAnEb.18268$CK3.1597418@news20.bellglobal.com>
Source record: 18024

Atarians,

I purchased a cable which can be plugged into the back of my Atari 800 XL. It connects to the monitor port and splits the signals into four separate RCA cables (red/white/black/yellow). I then acquired a cable that converts two RCA plugs (black/yellow) into an s-video adaptor. The black and yellow wires coming from the first cable are chrominance and luminance, of course. Unfortunately, I wasn't getting a signal from the my Atari 800 XL or my 130 XE, so I decided to do some research. Someone mentioned that the 800 XL doesn't produce a chrominance signal (actually they said it did, but the circuitry didn't connect the dots so to speak,) and I'm not sure about the 130 XE However, they also said that one of the RCA cables could be used as RCA input, but that didn't work either. Am I doomed? Am I doing something wrong here?

I am simply trying to improve the quality of video signal coming from my Atari machines.

Michael

I don't know. If you fed the GTIA with the 3.59 mHz xtal and the POKEY with the output of the GTIA, the timers, SIO, and tones should still work right. Hardware banging that relies on processor cycles for sound or video would definately be right out.

>
> 200-300 wires? wimp!! (nawww,,, I hate wires, too)
> Nothing to de-solder on a 1200XL, though.

No joke! My problem is I make a mistake about 1 in 40 connections. I am not a good debugger. My mistakes increase my debugging time exponentially. One mistake takes me an hour or two to debug, but 5-10 mistakes and I am out to 25-200 hours of debuggin.

FWIW: Developer boards are all over the place in what you pay for them.
Atmel virtually used to give away their developer boards before they got
rich and famous. They have raised their prices but are still a good buy.
Motorola used to and may still *GOUGE* you. I seem to recall them charging
~$7,000 for ~$100 worth of silicon soldered on a 6"x8" board.

I would bet no. Pretty sure it writes directly to display memory during the
VBI.
> I also found KEDIT. Do you know that one?

No. I am kind of goofy with what I use for an editor. I use anything with
the old Wordstar type editing keys, like <contol>Y for delete line. The only
editor I use on the Atari is Action! because it has a scrolling 255<?> line
length and nice cut and paste functions.

There was one other editor that I almost liked on the Atari. I think it was
something like Textwiz or Text Wizard. It scrolled the screen both
horizontally and vertically so you had a 80 column lines.

Hello Mike,

You are not doomed. I purchased the same cable that has the RCA
cables (red,white,black,yellow) and also a video converter. Using
this I was able to connect my XL to a SVGA monitor. The
improvement in picture quality is great...

I purchased the cable on eBay, but I have seen a few of stores on the
Internet that sell them. I would search on Google using the keywords
"atari monitor rca." You could even build your own, if you are so inclined.

I have seen video converters Edward was talking about too, such as the
one listed here:

http://www.pccables.com/cgi-bin/orders6.cgi?action=Showitem&id=ID1161755&partno=85501&sear
ch=MONITOR&rsite=pccables.com&rcode=

(Found using the keywords "rca svga converter")

I'm sure there are others available elsewhere, and I'm not sure if the
price listed is very competitive either.

hey -

That recent video related post sparked a thought in me...

Has anybody here used a converter so they can use their 8-bit atari with a standard PC monitor? (instead of a t.v.)

I see they do exist for sale. Anybody with personal experience?
I was thinking about looking into it, but wouldn't want to spend too much money on a 'toy'...
Nor am I interested in seeing a diagram of the video pinouts so I can make it myself.

ho ho ho

hey -

Did a lot of you atarians program on the 8-bits? Did you use just BASIC or did you know how to use the assembler editor or other?

Back in the day, let see, I would have been in my teens. I knew basic in-and-out...but, like so many, found it SLOW.
Even though I was decent at player-missile graphics, I rarely used it because everything I wrote fell to a crawl.
I usually used the "character set editing" trick for graphics.....maybe stole some USR related machine code from other games for a few tricks but that's all. I was just browsing through the stuff I wrote back in the 80s.

I remember finally getting the assembler editor cartridge, but the atari was on its way out, and I was busy on my new MAC.....using microsoft basic then pascal. I didn't really understand assembly-machine language on the atari...I had no teacher...all I knew was from picking up books. THERE WAS NO INTERNET....uh-oh....I almost passed out. Water please. Thanks.

Thought I would take a sounding of folks who use a BB/Floppy Board with HD disks. I am converting mine to ATR's (5760 DD sectors, 36 sectors/track). These disks were all new brand-name 1.44's, and now I'm picking up all kinds of errors from about sector 4000 and up (inner tracks). When these were written a few years ago, they had *no errors* when read back after writing. If I slow the reading down, they read ok with no errors. I've found no similar issues with 720K disks, but the number of errors with the HD's is still surprising to me. Anyone had similar experiences?

I wrote about 150 programs in BASIC (simple games mostly), and tried
quite a few other languages, Pilot (or was that Turtle? <g>) , Blue C, Macro
Assembler, etc...

The best language by far, was the Action! language from OSS. It had all
the familiar constructs, (If/Then, For/Next, Subs and Functions) plus it
allowed you to declare variables or compile at any memory location. The
compiler did little to optimize the code, but with the ability to include and
treat inline machine code as any normal Sub or Function, you had access
to the CPU it all its 8-bit glory....

> Back in the day, let see, I would have been in my teens. I knew basic
> in-and-out...but, like so many, found it SLOW.

I did a few BASIC programs that would require about 90 seconds for
the font to load, until I either found or developed a technique to load those
fonts in under a second. That method used the VVTP (Variable Value
Table) to allow the movement of data at machine language speed. It also
helped in other areas where movement of data was the main bottleneck, such
as moving a player vertically, loading all the sound registers, or fast screen
graphics, and so on....

After that, my BASIC programs weren't painfully slow, anymore!

I wrote an article about that VVTP method which was published in
Vol 4, No.2 (March/April 1995) of the Atari Classic Magazine put
out by Jim Hood and Bob Woolley. Unfortunately, I am unable to
find a link to any online version of that article....

Were you aware of that method?

> did you know how to use the assembler editor or other?

There may be some detail lost after ~30 years and untold gallons of beer.

First programming I did was on a Wang programable calculator. Really old dog with the magnetic "iron" donut memory. Only programable in Hex<?>.

First computer I programmed on was a homebrew 1802. That would have been in the later half of the 70s. There was a basic available, Pitman BASIC or something like that, on tape or EPROM for >$100 so I remained in machine language as opposed to assembly. No nemonics, just "D0 20".

I think I got a few programable calculators at the same time. A TI and maybe a HP11C which was their business calculator. The seemed like higher languages at the time.

Atari was my first computer with a BASIC. My background in non structured programming meant I wrote a lot of spagetti code and never produced anything of merit.

First language I bought for the Atari was ASM/ED cart. Next was Action! cart, but I still didn't get it. I wrote a fair number of esoteric assembler routines for people. Unless you were into ham radio and using an Atari with your set up, they wouldn't matter to you.

About this time, I don't recall even the decade<80s?>, I took a night class in C programming. Having structured programming explained to me made it all clear and I saw the light.

The structured thing really cleaned up my code on all languages. I still didn't really program in BASIC except by request, but even that was now readible and easy to follow.

Favorite language before I dropped out of programming was Action! I didn't just drop out of programming on the Atari, but everything. Restoring old motorcycles into rat bikes is my current time and money burner. It will probably be something else by next year.

Hi Larry -

I never heard of VVTP.
I haven't programmed on an atari since the 1980's. I didn't "keep up" with the programming aspects or news, after the 80s passed.

Some methods I came across back in the day were "over my head" - - - I was just a high school student. Everything I knew I figured out on my own. So, if I didn't understand something I was just stuck.

Now, I'm sure that stuff would make sense. But I barely have time to keep up with the latest & greatest PC technologies of today.

-take care,
Z

> I never heard of VVTP.
> I haven't programmed on an atari since the 1980's. I didn't "keep up" with
> the programming aspects or news, after the 80s passed.

Basic kept a section of memory to hold variable names (VNTP) and a
section of memory to hold their values (VVTP). In the case of strings
and arrays, the value table had pointers to the memory where the string
data or array data was kept. Using Poke, you could make it appear that
the string resided anywhere in memory. Making one string look like it
was right where the system font resided, and making another string look
like it resided where you needed the copy, the entire font could be
copied using a simple string assignment:

dst$ = src$

Likewise making a string look like it resided where the screen RAM was,
simple string assignments could fill the entire screen very quickly.

I bought my first Atari in 1982, but I didn't move to PCs until 1995.
At that time I was introduced to Visual Basic, and as you might imagine,
I have now become somewhat of an expert in that language!

# 6428. "Ultima I" inspired me as a youth

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-21 11:21:25 UTC
From: Steve S <j70141@hotmail.com>
Message-ID: <66aadc5873469a526c4fd52f204f1651@news.teranews.com>
Source record: 18041

When Ultima I came out around in 1983 (or sometime around there), I was not even a teenager. I was already programming my old Atari computer like a real pro and was much brighter than most people my age.

I sat down at Ultima I for the first time and saw things that I had never seen a computer do before. I saw how it laid out a map with water, trees, and cities. Even more so, I saw the 3 dimensional dungeon that I could explore (though it was rather small).

It inspired me, and I wanted to know how the trick was done. I wanted to learn everything that I could off of that computer and learn all the tricks of the trade and do it myself so I could create games just as good for the public to play.

Times have changed now. People rarely get 'royalties' for their games. Games have to be made in teams, usually for a major corporation, due to their sheer size and complexity now. Software Engineers are now just employees working for the company, and are no longer the authors and inspiration of games that go out. Games are usually designed by someone higher up and delegated to the Engineers down the line.

Times may have changed, but my taste for programming has not. Though it is not something I am pursuing as a career any longer, I still do it as a hobby and enjoy that hobby very much.

Just a couple of days ago, the idea popped into my head again about "wanting to know how the trick was done". I theorized my idea in my head and decided to set out and do it. I was going to create a 3D dungeon, just like the one I saw for the first time when I played Ultima I.

I hadn't done java in a long long time, but since I have a class on it next semester, I figured I should get back to re-learning it. It took me a couple of days, but I was finally able to make it, and it looks almost exactly like the Ultima I dungeon.

I invite you all to try it out. The maze is rather small right now, but I will be changing that in the next few days. I specifically wrote the code so that it would be extremely easy to change the size and shape of the dungeon at my very whim.

http://complabs.nevada.edu/~stephen7/MazeRun.html

Have fun.... it isn't much, but it was exactly what I set out to do, and I did it without any help or special learning in this type of construction.

# 6429. Re: programming

Source record: 18042

Machine Language programming was the one thing I wanted to do badly but could not. There were a few problems. The first being that I was not even a teenager yet, and could not make the money needed to buy one. My parents were too cheap to buy an assembler cartridge or the books necessary to do it, so I was stuck with whatever I could get my hands on.

Fortunately however, they DID subscribe to ANTIC magazine which provided a wealth of information on programming the Atari. Problem was that things often moved slowly due to Atari's desire to keep several programming techniques and memory locations a corporate secret.

In any case, I ended up doing very little machine language programming in my youth and mostly basic. About a year or two ago however, I did get back into it once more and have looked into 6502 programming and very much like it. I am discouraged however in that there is little future for 6502 programming now.

Nifty! But what happens if a garbage collection occurs between the
time you poke the new addresses and actually perform the statement
above? I suppose you can try to limit use of temporary strings, or
even force a gc before doing this?

Ben

## 6431. Rarity Lists

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-21 15:31:22 UTC
From: Mike Tennyson <miketennyson@hotmail.com>
Message-ID: <40jFb.6687$2Y.4941@bignews4.bellsouth.net>
Source record: 18044

I have seen several lists on the net showing all Atari carts ever made and some have rarity rankings 1-10. Can anyone tell me where the best site is for this info? Who determines rarity and how? I am starting a 400/800 cart collection (getting back after 20 years!) and want to have a checklist as a guide.

Thanks in advance!

Mike

Just to follow up my first post. I managed to get the cable working. The problem, of course, was a silly thing indeed. The cable colour coding was based on a system several years old, when monitors that accepted chrominance and luminance as input were fairly common. The red and white cables were the chroma and luma cables (not audio!), and the yellow cable was the mono-audio signal. Still haven't figured out what the black cable is used for (maybe for stereo sound?)

The picture looks fantastic! I have the output connected to a television tuner card to save room on my desk top (although the output looks even better when connected to a television,) and I have my Atari connected to another PC via APE. The stage is set, the pieces are moving, so let the gaming fest begin!

Uh, Steve.
All I get is a grey box with a 13 at the bottom left.
Maybe you have some cgi or something that your ISP won't
run, or maybe my computer has java turned off?

So, Steve, how about programming something for the Atari
8-bit? You might even submit it to ABBUC's programming
contest.

I programmed it to say "crash" when you bump into walls. Was it saying
"crash" otherwise? The thing has been tested time and again on Internet
Explorer and works great for me... odd that someone else would have some
troubles. Perhaps his java is turned off or maybe he needs java installed.
I seem to remember something about Netscape (if that's what he is using)
downloading with bare minimums and having to add stuff little by little.

Pressing 'M' gives you a cheat map and pressing 'C' gives you a compass.
If you find a ladder, press 'U' for going up and press 'D' for going down.

Okay, I've had about 15 visitors so far... what do the other 13 think of it?
Any problems?

Odd... try refreshing the screen to see if that makes a difference. The number is just a webcounter. Check your java.. if necessary, check out the Sun website and see if they have a java pack for you to download.

I plan on using this program as part of a sort-of on-line resume so I need to make sure it works... let me know how it turns out.

> they said it did, but the circuitry didn't connect the dots so to
> speak,) and I'm not sure about the 130 XE

First make sure you are using the correct plugs. Trying each of them in turn to a video input you should get...a full color picture(video), a monochrome picture(lum), a ghost picture-rolling(chroma), and a lot of noise/no picture(audio). If you don't get this, the cable may not be wired for an Atari 8 bit.

This should work in a 800 or 130XE..but you know Atari, they may have some boards designs without chroma. Most 800XLs(600XLs) will NOT have the chroma line wired. I can put up the flyer I made on fixing this.

Also, the svideo adapter/cable may be at fault for following the spec. Most things cheat..they want the signal returns to be connected to the case shield. A meter can check this.

Once of the most popular ways is to use a capture card input.

yep, it said crash because I was hitting the walls. It works fine,
infact it is kind of too fast, maybe if you added color and textures
it would slow it down a bit. I think alot of people might not get
that you have to click on the applet before you can steer.

It works great for me! Nice work, looks kind of like the old Avalon Hill
game 'Voyager I' without monsters to run into. I noticed a couple of
infinite loops there, nice touch. I think if anyone has trouble with it,
they should go to Sun Micros website and download the latest runtime
environment. I think you'll find alot more things work right once you've
done this.

There are many of these, and they range from $50 to very big buck$ for professional broadcast equipment. The one linked in this thread is the "Cheese Box". In spite of its somewhat unusual looks, it appears to be one of the more competent designs. Many of these will only work with a color signal.

I've had 5 different kinds of these, and the "best" IMO is the ATI All-in-Wonder video card. The main advantage of using a PC video card is that the video is scaleable under Windows. I use APE a lot, and I have APE, my A8 screen, the Win file Explorer, and whatever dialogue boxes APE needs all open at once. The AIW also gives you a dynamite DVD player and a PVR that captures as MPEG and other file types. I have never used a USB capture device or add-on TV cards.

The down-side of the PC card is that you must have the PC up and running while many/most of the external scan-doublers and up-converters operate as stand-alone devices. I have also used a JAM!!, Instant-TV, the XGA Theater (very nice), and another ATI AIW. These all have slightly different sets of capabilities.

*If* you can provide good S-video signals from your A8, these will "knock your socks off" in VGA.

Larry

Actually, I had two features on there. One I had removed because I didn't think it was necessary, and the other I added recently. The second was a message saying that you had to click on the maze in order to use the keyboard (and press enter for help). Did you not see that part?

The first, I had removed because I didn't see it necessary. It was a feature that made you release the arrow key before you could make another move. Basically, one key press per move. I removed it because I felt there was plenty of time to release the key before it repeated itself (and went very very fast). Do you feel I need to implement this feature again? I have mixed feelings about adding a 'lag' feature...

Thank you for your input. I have my Java on high safety also, so that could not be it. I am however using version 6.0 of Internet Explorer.

Anyone else with problems, kindly check the "Help=>About" and tell me your version. Also, try "refresh" and try waiting a bit. I always get a gray box for the first 15 seconds or so, and I suppose if something went wrong in the transmission that it could happen.

Also, if any of you are using something besides Windows, let me know.
Thanks for the input everyone. I appreciate it.

I forgot to ask:

If you use the box you mentioned, do you still need the "GAME / TV" switch box that would typically attach?
OR do you just plug the atari's video cable into the "cheese box" instead of the tv/game box?

-thanks!
z

Doesn't Atari Basic do a garbage collection to rid temporary strings,
and move them (compact them) like other Basics? Most other Basics I'm
familiar with have a garbage collection that runs when the string
space is exhausted.

Atari BASIC required all strings and arrays to be DIMensioned before use
and could not be redimensioned without clearing all variables (CLR command).

The DIM statement actually set the maximum number of characters a string
could hold. It could hold less, but the DIMmed memory was not released.
Basically Strings were fixed in size by the DIM command, even though they
could hold fewer characters, garbage collection wasn't used.

# 6460. Re: Micro-Palooza!!! (fwd)

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-22 10:28:03 UTC
From: Robert Bernardo <rbernardo@iglou.com>
Message-ID: <Pine.GSO.4.56.0312220526010.11192@shell1>
Source record: 17973

Date: Thu, 18 Dec 2003 05:01:06 GMT
From: Clay Cowgill <clay(at)yahoo.com>
Subject: Semi-O/T: Shameless plug-- microPALOOZA!

Since old arcade games, old game systems, and old computers kinda go
together, I'm posting here in case anyone's interested...

If you're going to be in the vicinity of Portland, Oregon for the new year
you might be interested in a show/concert we're having at our arcade
(Ground Kontrol) in downtown Portland on Tuesday, December 30th.

In addition to the usual arcade games we have (about 60 classic machines
including a pretty good set of pinballs) we'll be hosting sort of a West
Coast Commodore user's gathering starting at 1 PM and turning into
"microPALOOZA" at about 6 PM.

microPALOOZA will be live music performed by at least four different
artists -- the interesting bit is it's all "chip music"... For those
unfamiliar with chip music (sometimes referred to as 'squarewave music',
'chiptunes', or '8-bit music'), it's created using old, old game systems
and computers like the Commodore 64, Gameboy, NES, Atari 2600, etc. as
instruments. Sometimes the occasional reprogrammed dot matrix printer.
If nothing else just the "instrument" setups are pretty amazing. A fun
little backgrounder is here: http://msnbc.msn.com/id/3131157/

Right now we've confirmed:
Seth Sternberger (performing as 8-Bit Weapon)
http://c64audio.valuehost.co.uk/8BitWeapon/
lodus http://www.lodus.tk/
MOS-8
gotoXY http://zebox.com/gotoxy/music & Waxin' Wary

There will be some well known Commodore scene people there for good
measure-- Dave Moorman (Loadstar magazine), Jeri Ellsworth (designer of
the CommodoreOne), Robert Bernardo (Fresno Commodore User Group) and
possibly Mike J Henry and/or Lawrence Hiler of Basement Boys Software if
I can talk 'em into it. ;-)

Anyway, the games will be on, the music should be cool (or at least
"interesting" depending on your tastes), and we'll be putting the new
store sound system built by Neil ("Retrocade") Bradley through its
paces... No cover before 4 PM, $4 per person after that. Should run
until about 10 PM with music starting around 6 PM.

Details and updates here: http://www.groundkontrol.com

Hope a few of you can make it. Come find me and say 'hi' if you do...

-Clay

I started with basic (fist i played on a zx81 :o)
making lots of little games, characters editors, etc... (all learned by
atari magazines from here , chile)
As i have no internet connection.. i was limited on my learning....
then i get some new software , and learned ASM (MAC/65) ... Wrote lot of
thing on that too... But, atari was never a great home computer system in
Chile .. mainly used as a game console. So my software was just for fun
(learning).
Most of the routines i wrote on asm, i ported to basic using xusr, to be
fast on memory writing/video writing, etc....

Nowadays , i dont recall most of the basic or mac65 instruccions... cause im
too into c/c++ , asm, pascal, etc..
That were great days ;D

Still that doesn't answer about temporary strings?
A "temporary string" is one that isn't assigned to a variable.
Like:
PRINT "HELLO" ; HELLO is a temporary string, and is placed in string
space.
A$="Hi There" ; "Hi There" is placed into temporary string space, then
assigned to the variable. Whether or not the variable is made to point
to it, or a copy is made and A$ is made to point to it I don't know.
Does it work this way on the Atari?

I suppose it (my original reason for posting the question) doesn't
really matter if it does, because the original post was about using
strings to point to other areas, and it seems that real string
variables would exist outside a space such as a "temporary string"
space anyway, even if one does exist.

Ben

Hi,

> Still that doesn't answer about temporary strings?
> A "temporary string" is one that isn't assigned to a variable.
> Like:
> PRINT "HELLO" ; HELLO is a temporary string, and is placed in string
> space.

No, it's not placed in string space for Atari Basic. It is placed in
the program space. That is, the string is directly taken from its
tokenized form on the program line and passed "as is" into the print
statement.

> A$="Hi There" ; "Hi There" is placed into temporary string space, then
> assigned to the variable. Whether or not the variable is made to point
> to it, or a copy is made and A$ is made to point to it I don't know.
> Does it work this way on the Atari?

No. "Hi There" is part of the program space, and a string copy is performed
from the program space into the string space reserved for A$ on "dim-ing"
the A$ string.

> I suppose it (my original reason for posting the question) doesn't
> really matter if it does, because the original post was about using
> strings to point to other areas, and it seems that real string
> variables would exist outside a space such as a "temporary string"
> space anyway, even if one does exist.

Atari BASIC has a very "static" design. Specifically, no garbadge collection
takes place. There's the variable table (containing the variable values for
numerical variables, or "pointers" for dimensioned arrays or strings), and
the program space, and the array space. As soon as you call "DIM" on a
variable, array space is extended to make room for as many characters/bytes
as needed. For DIM A$(20), 20 bytes (approximately) are reserved in the
array/string space. For DIM A$(2000), 2000 bytes are reserved, no matter how
long the string is. On assignment, memory gets copied back and forth.
String constants ("literals") are always part of the program and encoded
within the program as tokens. Thus, a construction like

```
10 A = ADR("FOOBAR")
```

would give you an address within the program space. If you poke into A, you
change the string and the program.

Greetings,
Thomas

# 6464. Ultima I site, fixes and updates

Newsgroup: comp.sys.atari.8bit

Source record: 17977

Thanks for your contributions...

The website has been updated. Those with the gray box problem, there is a link on the website (at the top) that should fix that. It's a free download and a recommended download at that, I'm not the only person that uses java applications.

There is also a much much larger maze. Link to the maze is at the bottom of the website. I think it may be difficult even for those that use the cheat map.

I disabled the feature to view Hidden Doors by default. It can be re-activated again, if you find the right key to type (there aren't many keys on a keyboard guys). I recommend trying the maze first before going straight into cheating...

Again, thanks for your input....

I did not try the link, I just wanted to say I don't have problems with other
java games, specifically the 100% java games found at www.popcap.com.

They are java games, and they play just fine....

If you are still having problems with my website, it would be a great help to me if you can try the link and verify that this would fix the problem. There is a chance that there is a version problem, as I used the most updated and recently released version from Sun.

Also, there is a difference between java and JavaScript, which most games use. I'm not sure if you knew that, but that may also be the case.

The link provided is the same java program that I use to create the games. Other people have no problems and some of the ones that report no problems have said that they have the latest update for java on their system (the latest update was released only a month or so ago). If you have the latest java properly installed, there will usually be an icon with the shape of a cup of java located on the bottom right corner (next to the time) when it is activated by going to the website.

If I recall the history correctly, I believe that java was originally created by Sun and Microsoft (as usual) tried to use lawyers to steal it and implement it into their Internet Explorer a while back. When that failed, java was somehow changed so that Sun had their stuff and Microsoft had theirs and the two were separated. I could be wrong, I am going by a very vague memory of the situation, but it could explain some things.

ok.
cool. how long did that take you do write?
It worked after I did the Java download and refreshed your site on my
browser.

Hey, what about an Alternate Reality maze? No, not the whole thing....just a
piece of it.

# 6468. Re: ABBUC software contest 2004...

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-22 20:08:18 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3FE74F31.6FF97436@students.uni-mainz.de>
Source record: 17987

Well,
it is a software contest for Atari 8Bit software held by ABBUC Germany. Nevertheless anyone (no matter if ABBUC member or not) from anywhere in the world can take part in this contest and write a program for Atari 800/XL/XE computers (the program must run on real machines). ABBUC does not want the copyright of these programs, only the right to release them on their magazine (which has 400 subscribers). To win a price your program must:
- run at least on a 64k XL/XE or a 128k XL/XE (real Atari!)
- be one of the following types: a) game (s), b) application(s) or c) OS (DISK-OS / DOS or Computer-OS)
- the program must be finished (no demo-version, pre-version, alpha/beta-version, etc. no demo or intro)
- the deadline is August 1st 2004
- run without any extra hardware (except 130XE ramdisk); ***
- auto-boot (from an ATR image or 5,25" Atari disk, e.g. using a boot-diskette or using a file disk with DOS + Autorun.SYS or a Gamedos loader)
- include a short (or long) description/info/doc. in english or german language about the program (what is it - what to do with it...) and its author (e-mail or postal mail adress);

*** (but: it can support any extra hardware as long as it does not require it and also runs on a normal Atari without that extra hardware; e.g. you can write a game for 320k Ataris, which also runs fine on 48k/64k or at least 128k Ataris; or you can write a sound player for stereo-ataris which also works on mono-Ataris; or you can write a sort of "defragment" utility for harddisk, that also works on various disk formats; or program a new DOS, a new OS, etc. etc.)

Send your programs to 1) software@abbuc.de (sorin pascu) or 2) wolfgang@abbuc.de (wolfgang burger). As said before, the author does not lose the copyright of the program, so he can freely release the program after the contest. The author nedn`t be there at the abbuc show, where the final decisions will be made and the prices will be set. For further info about the prices visit www.abbuc.de and read all about the software contest 2004 (available in english, german and probably other languages)... afaik, the first price is 500 euro plus 250 euro extra if it is a really high quality program... greetings, andreas magenheimer.

P.S.: Maybe this is our chance to see some demo-programs being finished then...

(what is ABBUC programming contest.)
ABBUC is the largest Atari group in the world, I would say.
It is Atari Bit Byters User C?, in Germany.
Wolfgang Burger is the President.
The programming contest is for the 8-bit, they are trying to
stimulate development for our A8s.
It isn't a trivial thing either, a top prize of 1000 Euros for a
game that meets the criteria.
I wish I could remember who notified this group of the contest
for this year, submission date September 15 (that I remember
it is my birthday.)
There were 3 winners this year, I was one of them with a
dice game I wrote, and I received a prize, so I know some of
you can do better. I may be wrong about 3 winners, but I'm not
wrong about me winning a very nice prize.
Was it Mathy Nisselroy, Carsten Trotman, Bo or Ernest Schreurs,
that notified us here?
Go to the ABBUC site, Google it.

Ooops, I forgot to mention, that no grand prize was awarded for
this year, so the money will be added to this year's contest.
Who knows, 2000 Euros? that'd be about $2200 I guess.
I believe the grand prize offered is 1000 Euros.

Thomas describes Atari BASIC strings.
Ok, I think I read that Thomas says DIM A$(2000) allocates
2000 bytes for the string when the program is run.
I know Thomas really knows what he's talking about,
but I thought A8 BASIC would not actually allocate the 2000 bytes
with the DIM. You have to initialize a string before it will actually
allocate the space, ie. DIM A$(2000) followed by
a reference to a segment of the string would result in a ERROR 9
DIM error. You have to initialize the string first, A$(2000,2000)="X"
I think would allocate the space. If you DIMed B$(20) lets say,
and had a line B$(1,10)=A$(21,30), or something like that would
give the DIM error.
Also Atari BASIC would sometimes give DIM errors even when you
did everything correctly, sometimes having to re-name a string variable.

LOL!!! Believe it or not, the 30x30 maze that I wrote (link on the bottom) was partially based on the Alternate Reality Maze (the dungeon).

Also, I have been putting serious thought into taking the graphics from Alternate Reality and changing the maze format accordingly...

I have always noticed that the strongest support for the Atari does appear
to be situated in Germany. Rather odd, but quite interesting. I have
downloaded many games for the Atari that ended up being written in German.
At one point, the game seemed very very interesting but I couldn't
understand the error message that it gave me so I wrote it down and brought
it to the University and handed it to someone in the languages department..

Beeblebrox tried it, and it worked for him, so evidently that upgrade will
work for others. I don't like upgrades every other month (it seems) so I
refuse to install software unless I plan to use it....

No - in Atari BASIC, you could execute a "DIM A$(2000)" in immediate
mode. Then, do a "? FRE(0)". The available memory will be down. I
haven't actually trie this in a program, but I imagine results would
be the same as they get executed in the same order.

That's Correct, the standard Atari Power Supplies for the 400/800/810/
1050/xf551/etc. is an AC power output. The Indus is a DC output. Most
likely the Indus is toast. ===Ben===

> I know Thomas really knows what he's talking about,
> but I thought A8 BASIC would not actually allocate the 2000 bytes
> with the DIM.

Well, unfortunately, it does. This is what happens with the Atari Basic
I have:

```
? FRE(0)
37902

DIM A$(2000)

?FRE(0)
35892
```

The memory for the string and for the entrance into the variable table
is gone now.

> You have to initialize a string before it will actually
> allocate the space, ie. DIM A$(2000) followed by
> a reference to a segment of the string would result in a ERROR 9
> DIM error.

```
?A$(2)
ERROR- 5
```

Not a DIM error, though an error due to an overrun index. Atari Basic
does keep the number of initialized/used characters along with the string,
even though the memory for the string is reserved.

> You have to initialize the string first, A$(2000,2000)="X"
> I think would allocate the space.

```
A$(2000,2000)="X"
? FRE(0)
35892
```

No, no memory reservation whatsoever.

> If you DIMed B$(20) lets say,
> and had a line B$(1,10)=A$(21,30), or something like that would
> give the DIM error.

```
DIM B$(10)
B$(1,10)=A$(21,30)
```

No, no error here (after the above line initializing A$).

?B$
(20 hearts appear)

A$ just has now the contents of the raw memory allocated for A$, containing
ASCII zero, the hearts.

> Also Atari BASIC would sometimes give DIM errors even when you
> did everything correctly, sometimes having to re-name a string variable.

Hmm. At least not that I'm aware of. Atari Basic came in several revisions,
and all of them had a couple of bugs. The most unfamous I'm aware of is
the "crash and die" bug of Rev B that sometimes hung due to a bad memcopy
routine. The above is all with Rev C, BTW, but that shouldn't matter.

So long,
Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

# 6481. Re: programming

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-23 17:11:09 UTC
From: russg <russg@en.com>
Message-ID: <vugtus3p71gm33@corp.supernews.com>
Source record: 17994

I'm terrible about not quoting.
Thomas straightens out what I said.
Not error 9, but error 5 if you try to use a string before initializing it.
I see the space for the string is allocated with the DIM, but something
keeps you from actually using the string unless it is inited, as in Thomas'
error 5 example.

## 6482. Re: programming

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-23 17:18:43 UTC
From: russg <russg@en.com>
Message-ID: <vugud2cp7bdifd@corp.supernews.com>
Source record: 17995

```
Uhm.
Also, let's say DIM A$(10)
? LEN(A$)

0 (zero).
A$ has zero length until it is inited.
Always init your variables, string, numeric arrays, or numeric, before you
use them for something. I remember a published Display List interrupt
creator in ANALOG that, I think, was edited by ANALOG people, to save space,
a Z variable for zero, it wasn't inited to 0 and caused the program to
crash. You can't assume there will be a 0 in a variable to start with. (I
meant program space saved, not magazine page space. It is good programming
practice in A8 BASIC to use a variable rather than a literal number, it
saves 6 bytes per use. eg N0=0, N1=1.
```

# 6483. Announcement: cc65 v2.10.0 "christmas edition"

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-23 20:54:32 UTC
From: uz@spamtrap.musoftware.de
Message-ID: <82aasb.jme.ln@news.musoftware.de>
Source record: 17996
Cross-posted to: comp.sys.cbm,comp.sys.apple2.programmer,comp.sys.atari.8bit,comp.sys.oric

I'm proud to announce cc65 version 2.10.0 ("christmas edition"). cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- The Commodore VIC20 (contributed by Steve Schmidtke <steve_schmidtke@hotmail.com>).

- The Commodore C64 and C128.

- The Commodore C16, C116 and Plus/4.

- The CBM 510 (aka P500), a quite rare Commodore machine (programs run in bank 0).

- The CBM 600/700 family (programs run in bank 1).

- Newer PET machines (not 2001)

- The Apple ][ (library support by Kevin Ruland <kevin@rodin.wustl.edu>)

- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler <cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga <taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).

- GEOS for the C64 and C128 (by Maciej Witkowiak <ytm@elysium.pl>)

- The Nintendo Entertainment System (NES) (contributed by Groepaz, <groepaz@gmx.net>.

- The Supervision console (contributed by Peter Trauner, <peter.trauner@utanet.at>) (startup code and linker config only).

- The Oric Atmos (this one is BETA!).

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

Changes to the last version:

This is a major release with many new features and (of course) bug fixes. Lots of things have changed since the last major release. The compiler itself got only a few user visible changes, but there are many visible additions to the libraries. Hardware support has been much improved thanks to the help of many contributors. Serial drivers are now loadable at runtime, which means that applications can support a much broader palette of serial devices (and can

even support hardware that wasn't known when the application was built). Serial support is now available for more machines than before, so the Contiki team has something to do over christmas:-) Lots of new extended memory and grahpics drivers are available. To sum it up: Library support for more platforms and better library support for existing platforms. The assembler has gotten some nice enhancements: Better 65816 support, improved scoping, and the addition of structs/unions and other high level constructs. And last but not least: The documentation has been extended, the function reference is much more complete, and there are now docs that outline the special features for each platform.

See the (almost) full list of changes below for more information.

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Linux. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper and the target specific libraries. To develop for one of the predefined target systems you need the compiler RPM package *and* one of the target machine packages.

Starting with this version, the docs are also in a separate package, so if you want docs (recommended), be sure to download the cc65-doc archive.

Binaries for DOS and and Windows will follow or may already be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one or more of the target machine packages, plus optionally the doc package.

Download:

For more information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Mailing list:

There is a mailing list for discussing cc65 related issues (programming, suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

---

Thanks to all who sent feedback and suggestions, and of course to anyone who helped developing cc65.

I wish you a merry christmas and lots of fun with this new cc65 release!

Regards

Uz

---

List of changes for 2.10.0:

* Assembler:

- New .FORCEIMPORT command.

- New address size override symbols (z:, ...)

- New macro package "cpu".

- New assignment operator :=

- INCOMPATIBLE CHANGE of the .CPU pseudo variable

- New pseudo functions .SIZEOF, .HIBYTE, .HIWORD, .LOBYTE, .LOWORD,
.BANKBYTE

- Structures, unions and enums: .STRUCT, .UNION, .ENUM and .TAG.

- New, improved scoping rules.

- First support for far and near segments/procedures.

* Compiler:

- Flexible array struct members.

- Provisions for handling arguments to main()

- Rewrite of the type conversion.

- New keywords (some of them only in non ANSI mode): far, near, __far__,
__near__

- Slightly improved code in a few situations.

* Linker

- New directory search options.

- Generation of debug info is now "official" (but the format of the file
may still change). NOTE: The VICE label file will go in the next
release, so if you are using it for some other purpose than feeding it
into VICE, please think about using the debug info file instead.

* cl65 utility:

- Small additions to track changes in the tools called.

* ca65html

- New --linenumbers and --linelabels options

- Ability to convert tabs to spaces in the output

- Colorization

- Can generate links to the C source files (must be generated by c2html)

* Library

- New directory functions for the CBMs contributed by Josef Soucek.

- Joystick drivers are now loadable modules. The old statically linked code has been converted to loadable drivers and is no longer available.

- Library support for the NES by groepaz <groepaz@gmx.net>

- system() function.

- isblank() is "official" in C99.

- Arguments passed to main for several platforms (includes GEOS!)

- The open function for the CBMs will no longer add a file type, so files of any type can be opened without changing _filetype.

- Joystick driver for the Apple 2 contributed by Stefan Haubenthal.

- Two joystick drivers for the C64 contributed by groepaz, one of them converted to c128 by me.

- Minimal Supervision support (linker config and startup file) contributed by Peter Trauner.

- Several graphics drivers for the C128 and GEOS written and contributed by Maciej Witkowiak.

- New ramcart extended memory driver for the C128 written by Maciej Witkowiak.

- Two new Apple ][ TGI drivers contributed by Stefan Haubenthal.

- One new extended memory driver for the Apple ][ contributed by Stefan Haubenthal.

- New serial (RS232) driver architecture. RS232 drivers are now loadable. Drivers are available for C64/SwiftLink, C128/SwiftLink and Plus/4 (builtin ACIA). The latter is not tested because of the lack of an RS232 interface on my side, but since it is to more than 90% identical to the (tested) C64 version, there's a good chance it will work. The old static drivers are still available but deprecated. They will get removed in one of the next releases.

- INCOMPATIBLE CHANGE for GEOS applications: Exiting main() now ends the program. Before, exit() had to be called explicitly. Please read the docs!

- Full file I/O support and other improvements for the Commodore 610.

- RAM extended memory driver for the CBM610 does now work.

- New loadable serial driver for the builtin ACIA of the Commodore 610.

- More small changes/additions.

* Documentation

- Platform specific docs for the Atari, C128, C16, C64, Plus/4 and CBM610.

- Much extended function reference.

- Documentation for ca65html (an assembler source to HTML converter)
added.

- Lots of other additions.

* Other

- New co65 utility that allows to convert an o65 file into an assembler
module, so it can be linked statically.

- Changed object file format.

- Disassembler ready, documentation added.

As an interesting side note: There was actually a program out that did
that kind of variable assignment automatically. It checked for all
numeric constants in the program and replaced the most used ones by
pre-initialized variables it extended to its end. Looked kind of silly,
but this does, indeed, speedup programs and keep them shorter. Less
readable, too. (-;

Merry Christmas to all of you!

Greetings,
Thomas

Have you looked in the samples subdirectory? There's a program named
"hello.c". Can you guess, what it does? :-)

Note: Sample programs are part of the documentation, so you need to download
the doc package in addition to one or more of the compiler binary packages.

Merry christmas!

Uz

# 6489. NMIRES for DLIs?

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-24 16:43:26 UTC
From: Sascha Springer <sascha.springer@t-online.de>
Message-ID: <bscfne$qao$06$1@news.t-online.com>
Source record: 17902

```
Hi!

The Atari 800 XL jumps to this NMI handler:

C018: 2C 0F D4 BIT $D40F [NMIRES/NMIST]
C01B: 10 03 BPL $C020
C01D: 6C 00 02 JMP ($0200)

C020: D8 CLD
C021: 48 PHA
C022: 8A TXA
C023: 48 PHA
C024: 98 TYA
C025: 48 PHA
C026: 8D 0F D4 STA $D40F [NMIRES/NMIST]
C029: 6C 22 02 JMP ($0222)

Question: VBI will be handled with a NMIRES call while DLI won't, so how
does the Atari reset the NMI status for DLIs?

TIA
Sascha
```

> These disks were all new brand-name 1.44's, and now I'm picking up all kinds
of
errors from about sector 4000 and up (inner tracks). <

No replies on this, but I did make an interesting discovery. The disks and the data are fine. I can read these at full speed perfectly with the built-in "TaskMaster" that resides in the BB/FB firmware. The errors are from MyDos which evidently can't keep up. But MyDos has no trouble with a hard drive. So I'm puzzled -- perhaps a different path with the data coming in over the PBI as opposed to SIO/pokey? Hmm. That also reminds me, the Taskmaster may have a really scrunched down display list which frees up more cycles for the 6502.
Any ideas?
Larry

BASIC from 1982/3 until I got a modem and found TurboBASIC XL in 1991/2.
Then picked up an Action! cart and went to down for a few years.
Last major Atari development was so long ago - 1997. Been meaning
(planning and scheming) to do more. Haven't had the energy or time.
So many irons in the fire. :^(

Sounds exactly like me for most of my programming lifespan. :)

IIRC, you helped me a lot when I was first picking up Action! Thanks for
that. Glad you're still around c.s.a.8, even though you're working
on motorcycles.bikes.rat ;^)

Happy holidays!

Honda names their bikes like Atari so it isn't too much of a change. Just
got a 350XL running this summer and managed to scrape off large software
patches.<sick>

I am currently working on stuffing a Suzuki TM400 engine in a TS250 frame.
It should be suitibly insane to the point where I take up programming again
from a hospital bed!

Nope, no ideas other than the reminder of the fixed bug in BBXFER.COM.
What version of MyDOS are you using? Does the 'sidedness' indicator
for the 1.4 drive you are using show it to be double sided? eg '='?
I've got the Floppy board but as yet haven't installed it so I'm
not much good for trying it here. I'm watching and interesed, so
don't think nobody cares, I just don't have anything worthwhile to add.
I'm suspicious of 4.53/4 as it doesn't show the sidedness correctly
on my setup and Mathy reported a wild bunch of strange stuff that
I've always blamed on 4.53 MyDOS. But it could be that it's just
fine and I never gave it a fair chance before.

Yo, yo-yos,

cc65 is like FREE. It is under a GNU software license.
Repeat, cc65 is FREE, as in NO COST.

Best regards,

# 6503. Looking for a "flexible" sector copier

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-25 10:48:34 UTC
From: llppwhite@aol.comnsp
Message-ID: <20031225054834.13580.00001710@mb-m10.aol.com>
Source record: 17916

Hi All-
Perhaps a solution to my (1.44 HD -> ATR) archiving issues would be a to find a two-drive sector copier that will do more than 2880 sectors. I need to do at least 5760 DD sectors, but I've never seen one that would go that high. (80 tracks, by 36 sctors/track, two-sides, DD.) Or perhaps one whose author has graciously included the source code, so it could be modified fairly easily.
Anyone know of one that might fit my needs?
Thanks,
Larry

# 6504. Re: Floppy Board HD Disk Errors

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-25 11:20:35 UTC
From: llppwhite@aol.comnsp

Source record: 17917

> What version of MyDOS are you using? Does the 'sidedness' indicator for the 1.4 drive you are using show it to be double sided? eg '='? I've got the Floppy board but as yet haven't installed it so I'm not much good for trying it here... <

Hi Lee-
Congrats on getting your FB. The BB/FB is really a great combo! I hadn't thought of this being a MyDos version problem, but I'll try that. I am using 4.50, but I'll try 4.53 and see. In order to use 1.44 HD disks with MyDos, you have to tell it that it is a Hard Drive. Otherwise, MyDos's max sectors per track is 26. All-in-all, I would probably have been better of using that configuration, since 36 sectors/track is evidently "pushing the envelope" of reliability.
FWIW, a FB also has problems with the Windows-format 1.44 disks with 512-byte sectors. But no problems at all with 720K Win Disks, so if I need to move just a file or two to the PC or back, I normally use BBXFER19.COM with 720K PC format disks, but formatted by the FB. Win pauses for a second when it sees the format, but reads them well.
Thanks for the ideas, and (everyone) have a great holiday with lots of "toys!"
Larry

> cc65 is like FREE. It is under a GNU software license.

Yes and no. It is free, but according to Ullrich's page, it
does not fully apply to either (??) of the licenses listed in:

http://opensource.org/licenses/

probably because it is based on a copyrighted but freely
distributable version from the beginning. Not that it matters
for most of us who yet haven't become licence religious.

Hi, Larry.
I wrote a very flexible sector copier/utility. I don't know if it will
meet your needs, don't remember if I put a 720 sector limit on it.
It is in BASIC, so yes, you have source code to work with.
It was designed to do sector reads/writes for a PC<->A8 transfers
I did for both the A8 and PC.
Anyway, if you wanna look at it look at
ftp://ftp.spudster.org
in the emulators/transferutilities it is called pcutil34.zip and
has about 5 files in it. The one is called SIOPLUS34.BAS.
Hahahahaha.
Russ

It is very flexible, but you may not understand what it can do from the
menu type options you have.

I tried and found out that Atari800 emulator for Amiga does in fact work under MorphOS. I put up a simple page about this to facilitate things for MorphOS users who want to give it a try. Check out my Atari800 on MorphOS page here:

http://linux.tc3net.com/daclmi/atari800.html

No joystick support though, oh well.

> does the Atari reset the NMI status for DLIs?

The hardware docs I have say nothing about this issue, but I assume that ANTIC resets the NMI signal itself at the end of the line. It's a flank sensitive signal to begin with, so it doesn't need manual deactivation after the interrupt has been handled as there is no chance the interrupt will enter itself again.

Greetings,
Thomas

Thanx!

Resetting the signal at the end is what I am doing now, so I guess it's
the best solution and the most obvious one as well! ;)

Regards
Sascha

I love Hondas! I've had at least 4 that I can remember,
CB650,CL100S,Hawk500,CB450A.
The one I miss the most is my little CL100S, A little one banger with a 5
speed. It had a huge chrome tailpipe that gave it an aircraft look. I called
it the red barron, I even had a gas cap with Marilyn Monroes picture
laquered on.
Great bike!

Anyone have a copy of the Ultima IV atr image in color? Mine appears in black and white for some reason, I am guessing that it is a different version.

For those that are curious, I did purchase the original a long time ago, I even still have the box and map somewhere... I do not have the disks, and I haven't turned on my Atari in a long time.

One of the other ones that is "In Process" is a circa ~1973 125SL for my
S.O. My family ranch is ~155 acres in the foothills above Morgan Hill Calif
so...
Little woman has pickup truck and I don't. I figure If I get the SL running
and say it is hers, I will get transportation for me and my bikes to the
ranch.<grin>

I started off on a Honda 90 when I got my learners permit in 1965. Picked up
a honda 50 for chopping up and riding around the farm too. About college
years I got a 500cc BSA twin, put in high compression pistons, cam, that
kind of stuff, and rode that a while. About the same time I got a Honda
Minitrail for my kids and it is funny how I spent more time on the Honda
Minitrail then I did on my beezer. Fell harder too as I recall.

There's just something about a lightweight easy starting thumper. I will
probably spend more time on the SL then anything else.

# 6514. ADV: Bravo's Atari New Years Resolution!

I can agree with that. I loved the Ultima series especially on the
Atari. I played 1-6 on the Atari and have not played 7-10 yet
since they are on the PC. Too bad Richard G. ended Ultima. Would
have been nice to see it keep going.

>Times have changed now. People rarely get 'royalties' for their games.

>higher up and delegated to the Engineers down the line.

Yes, that is correct. That is why I consider the 8-bit years the
best. It was so different back then than it is now.

(Honda motor cycles).
I started on a 50cc Puch scooter, in about 1966.
Then I got a 250cc Yamaha two cylinder two stroke, plenty fast.
Then I got a 350cc two cylinder Honda four stroke.
I now own a 1000cc four cylinder Honda Gold Wing.
My son crashed it on black ice in Georgia and it sits in a
garage in Tennessee (I live in Ohio). The fairing is all busted,
the brake resevoir on the handle bars is busted, the front fender
is broke.
Some day I hope to bring it to Ohio to work on. It is a 1978.

Steve -

You probably just need to set your emulator to use "color artifacting".
Ultima, for one, is a game that will turn up black&white if you don't set
the emulator.
I can think of another off the top of my head.....the game DROL also uses
artifacting.
That'd also turn up in B&W if you don't set it.

I assume you mean that you used the ST. As far as I know, the Atari 8-bit only went as far as Ultima IV. I know Ultima V was on the ST, but I am not sure of what more. I quit playing after Ultima 5 because the layout changed dramatically, and I did not like it.

Also, I think the author of Ultima ended up with Ultima Online, which is still in effect.

Also... more importantly, I found an very interesting online Ultima game which goes off of the Ultima V format. I have found it quite interesting so far, and it is 100% free. I recommend trying it, if you played Ultima V, the game will be very easy and familiar to learn....

I just recently installed the Xformer 2000 on my PC and I am having
trouble getting any files to run. I assigned game files (i.e.;
JOUST.XFD & MSPAC.ATR)
to drives D1: & D2: respectively. When I use the dos to do a
directory or load the game, I get an error.

Maybe I'm just not doing something right. (Well, obviously!)

The online instructions at www.emulator.com are lacking and I need
someone's experience using this program.

Thanks in advance!

# 6532. AtariWin800 v3.1 emulator question

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-28 01:37:31 UTC
From: "Z.Beeblebrox" <the.z.guy@comcast.net>
Message-ID: <wO6dnXSXv6JBrnOiRVn-uQ@comcast.com>
Source record: 17945

Hello 8bit gang -

I am using the AtariWin800 v3.1 8-bit emulator and decided to try the NETWORK feature. I wanted to test multi-player. Hey, maybe I can round up a 4-player M.U.L.E. game someday! Then I can die in peace (well, only after I win as the purple gollumer)

The emulator uses "Kaillera" client to join users across a network. I thought it would be cool to test since I have a number of PCs at my house. I'm too embarrassed to tell you the number. One PC would be the server and the others the clients - simple enough. Okay, the number's high.

So I downloaded the Kaillera server program (which is really easy to operate, thanks) and ran it on a PC. The Kaillera client is built in to AtariWin800 v3.1, so no download required there. Just run the emulator.

Then I loaded up AtariWin800 3.1 on two of my PCs at home. Both are identical. I ran MULE on the first one, then told Kaillera to start it up as a new network game. OK - so far so good.

I told PC #2 to find the Kaillera server on my local LAN/network and it did. Cool. After chatting with myself over the home LAN for a bit, I decided to join the MULE game (it gets boring after awhile, chatting with yourself, cause you usually know what you're going to say next). But to my dismay, PC #2 reports, "No ROM image available". So, I sat and stared. Then I blinked. Then I stared some more. I may have squinted at one point...it's all a blur now....I was definitely puzzled and later a bit annoyed. Then I thought....er.....um.......what? ............uh............wha?

So that's where the problem rests, my fine Atarians. I have 2 identical PCs on my home network/LAN; they can see each-other fine, but I get that ROM not found error. Both PCs have the same copy of the "mule.xfd" image, in the same place on their local C:\ drive. I can run MULE on each seperately just fine. And as I said, network wise, I'm okay too since I used "kaillera" to join up then chat with between both machines.

Why the ROM missing error? Input, anybody? Input A$, anybody?

-thanks for your two bits in advance,
Z

Don't know about Ed, but I have mine on an AVToolbox AVT-3340 from
http://www.avtoolbox.com/upconverters.htm, and it looks decent. I wouldn't
call it perfect, but it's nice if you want to consolidate to a single
monitor and KVM switch (like me).

I am "Phibes." This game is so great! It really recalls the Ultima IV
game I played years ago. In some ways it's a bit easier, but this is
not to say the difficulty is set too low. It is easier in that you
don't have to gather and mix ingredients for spells. But it's about
the right difficulty to be challenging.

I should also point out that the installation is trivially easy. It
seems to work almost "out of the box."

Thanks for referring us to this game!

# 6543. Atari 2600 Computer -- for real now!

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-29 04:30:40 UTC
From: Paul Allen Panks <panks@sdf.lonestar.org>
Message-ID: <bsoalg$3rk$1@chessie.cirr.com>
Source record: 17856
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit

It is possible to have a "true" computer module for the Atari 2600 -- if you are willing to use an old Acorn Atom computer as guts!

NOTE: Only experienced techies should attempt to follow the modifications suggested in this guide. Also, you must be proficient in 6502/6507 Assembly Language. Also note, this is a parody and is meant as a joke. Please do not seriously consider creating a VCS computer using Acorn Atom as a base -- the Acorn Atom sucks!

Other than that, keep on reading! :)

The following chips reside inside the Atom:

(from the website: http://www.users.globalnet.co.uk/~thoth/atom/atom.htm)

6502 Microprocessor
6847 Video Display Generator
2114 RAM chips
6522 VIA
8255 PIO
8271 Floppy Disk Controller
6854 Advanced Data Link Controller

Although the Atari 2600/VCS has a 6507 microprocessor, the 6502 is largely compatible. In order to connect the Atom computer to your VCS, you will need to create a VCS-cartridge compatible connector to plug into the VCS cartridge slot.

A good place to start is at Radio Shack, where you can purchase the necessary supplies to begin designing the VCS cartridge-to-Acorn Atom connector.

Once you have done this, you need to write a short (but sweet) operating system that will be able to LOAD and SAVE programs from a Desktop Tape Recorder. You should also spend some time writing a BASIC interpreter, as well as creating a BIOS for use by the VCS.

You will also need to modify the Atari VCS board to accept regular "walkman" style headphones -- aproximately 5mm in diameter. There is enough space on either side of the VCS Revision 8 or 16 boards to allow for the upgrade. This upgrade will allow you to plug any Desktop Tape Recorder into the VCS for saving programs to cassette tapes.

Once this is done -- usually on your 23rd or so lunch break -- you can then begin to add an additional ROM chip to the VCS motherboard (preferrably 8KB, enough to hold the BIOS you wrote earlier). Burn this in

carefully, making sure to use the proper EPROM utilities.

Finally, make sure to paint your VCS blue, as we all know -- BLUE computers run much faster! ;)

Once this is done, you should see the following screen upon powering up your new VCS/Acorn Atom computer:

```
Atari Acorn Atom Computer
3769 Bytes Free.
Ready.
*
```

The Atari Acorn Atom BASIC language consists of the following built-in commands:

CREATE SPRITE
Use this command to place a SPRITE on the screen (0-2).

MOVE SPRITE
Use this command to move a SPRITE on the screen (0-191,0-88).

ROTATE SPRITE
This command rotates your VCS sprite in 4 possible directons (0-3).

BYE SPRITE
This will make a SPRITE disappear (0; 1 makes to appear as a negative image)

NO LINE
This will make the stupid "line" on the screen in some games vanish completely (0; 1 makes the line appear as a negative image)

GRAPHIC MODE
This sets the graphic mode (0 is text; 1 is 192x88; 2 is 96x88; 3 is 64x48).

PRINT
This command will PRINT a word on the screen. Default argument is 0.

FOR
This will set a loop from 0 to 32767.

NEXT
This will increment a step within a FOR/NEXT loop by N value. N is optional.

IF
This is a conditional command. IF something is true, THEN do it.

THEN
Part of the IF/THEN turnpike. Use cautiously.

GOTO
Branches program execution to a line or name specified. Example: GOTO HELL

GOSUB
Branches program execution to a line or name specified. Example: GOSUB TRACT

MEM
This command tells the user how much memory is left in the VCS. Optional.

VCYCLE
This command will force a VSYNC refresh.

PLAYGROUND (On/Off)
This command will alternate between the playfield graphics and a picture of nothing. Usually just a blank, dark screen.

DEMO
This command will make the VCS cycle through "demo" mode, complete with a 256-color horizontal rainbow.

READ
This command READs in DATA from DATA statements. Self-explanatory.

DATA
This command contains DATA elements, i.e. numbers, letters and values READ in by the READ statement. Example: DATA 1,2,3,"Atari","Rules my goat."

ATARI!
This command does nothing, really. All it does is make the programmer look cool.

REM
A REMark statement is ignored by the Atari Acorn BASIC interpreter. This allows people to insert comments into their code. Example: REMember the Alamo!

RND
This is a built-in function that allows the Atari to process pseudo-random numbers. Example: X=RND(.85)

INT
This is a supplement to RND. Example: I=INT(RND(1)*35)+1

STOP
This pauses execution of a program until a CONT statement is issued.

CONT
This resumes program execution after a STOP command is issued. NOTE: You must immediately follow STOP with CONT, or else a "?WTF" command error will result.

INPUT
This command takes user input from the keyboard and prompts the user for a sentence (or a letter/number). Example: INPUT "What is your name?";A$

OPEN #
This command OPENs direct file access to the Tape Recorder. Use file channel 4. Example: OPEN #4,"myfile"

CLOSE #
This command CLOSEs direct file access to the Tape Recorder. Use file channel 4. Example: CLOSE #4,"myfile"

PRINT #
This command writes to a file OPENed previously. Use file channel 4. Example: PRINT #4,A$

GET #
This command gets from a file OPENed previously (sequentially, one letter/number at a time). Use file channel 4. Example: GET #4,A$

COLOR
This command sets the text color (0-127). Example: COLOR 15

FGCOLOR
This command sets the foreground color (0-127). Example: FGCOLOR 2

BGCOLOR
This command sets the background color (0-127). Example: BGCOLOR 10

PAGE
This command switches between pages in RAM. Useful in 1K chunks. Optional operator specifies read/write compatibility. Example: PAGE 2,1

That's all for now. Check out for details on the Atari Acorn Computer at:

http://www.atariacorncomputer.com/

(note: this site does not exist)

Cheers!

Sincerely,

Paul Allen Panks (a/k/a "Dunric")

# 6544. Need Atari 400 lower case

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-29 04:40:05 UTC
From: Julian Wolfe <julianwolfe@earthlink.net>
Message-ID: <FeOHb.4773$d4.1660@newsread1.news.atl.earthlink.net>
Source record: 17857

Hey all,

I bought a 400 off of eBay and I need a lower case assembly, as it was
smashed in the mail.

Also, if the same person has a working 410 unit they'd like to be rid of,
I'd be happy to pay a few dollars for it too.

Thanks!

Julian

# 6545. OT: (Plz Forgive) Super Amazing Gigantic Computer Collection

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-29 04:47:08 UTC
From: "mark@mmhart.com" <mark@mmhart.com>
Message-ID: <mdcvuvoernkj30g0ndn6kmld2afoeqdv9l@4ax.com>
Source record: 17858

(Sorry this is OT but I wanted to ad to the hard core folks who might be interested in this)

I am selling a vintage computer collection that I have been working on for almost 10 years. It contains many computers from many different companies that span the late '70s, 80ï¿½s, and early '90s. All systems come with original software, manuals, books, magazines, videos, keyboards, monitors, mice, etc...

I have also tried to collect very interesting and rare items including an original 1978 Apple II Reference Book from Apple, twin Macintosh 512ks with some fantastic accessories, a complete TRS-80 Pocket II Computer, and many other items.

I could not possibly list everything that I have so I created an entire web site (not a page) so you can browse through the pictures, background, statistics, and other information. I have treated these systems with the greatest care and I think youï¿½ll see that when you browse through the gallery.

I have been approached by many people to split up the collection but I would rather not. My hope is that this collection will be purchased by another collector (new or established) or a computer museum and added to their history of digital technology.

If the winner wants to do shipping then they will be responsible for paying for it, however, it might be better to arrange for the winner to pickup the collection. We can work something out.

If you're a fan of Commodore, Apple, Macintosh, Amiga, TRS-80, Timex, etc...you'll at least want to browse my pages for a trip down memory lane.

I'm asking: $580.00 OBO

If you have any questions, please do not hesitate to ask.

You can go to http://www.mmhart.com/Collection.htm for more information, pictures, etc...

Thanks!

# 6547. Looking for Magazines / CGW, Questbusters, New Zork Times...

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-29 06:56:47 UTC
From: Darkstar <darkstar@magma.ca>
Message-ID: <PeQHb.2249$Vl6.563714@news20.bellglobal.com>
Source record: 17860

Hello!

I'm looking for your help in completing my sets of magazines. I have noticed that there is not too much information available on the WWW regarding most of these magazines and am hoping to open up an on-line computer magazine museum. I am willing to buy, or trade for some of my duplicate issues (e-mail me and I can give you a list). I'm looking for the following issues of 1980s/early 1990s magazines and newsletters:

_Computer Gaming World_

1982 ï¿½ 2.2 (Mar-Apr), 2.4 (Jul-Aug), 2.5 (Sep-Oct)
1984 ï¿½ 4.1 (Feb)
1989 ï¿½ 62 (Aug)
1999 ï¿½ 182 (Sep)

_The New Zork Times (Infocom Newsletter)_

Vol I no. 1 (not actually numbered, one single page)
Vol II no. 1 (Fall 1982, one double-sided page)
Vol III no. 1 (Spring 1983, one double-sided page)
Vol II no. infinity (Summer 1983)
Vol 3.1 (Winter 1984), Vol 3.2 (Spring 1984), Vol 3.3 (Summer 1984), Vol 3.4 (Fall 1984)

_InCider_

1983 ï¿½ Jan, Feb, Mar, May, Jul, Sep
1987 ï¿½ Jun

_A+_

1983 ï¿½ 1.2 (Dec)
1984 ï¿½ 2.1 ï¿½ 2.12 (Entire year)
1985 ï¿½ 3.1 ï¿½ 3.12 (Entire year)
1986 ï¿½ 4.1 (Jan), 4.2 (Feb)

_Softalk_

1980 ï¿½ Sep, Oct, Nov, Dec
1981 ï¿½ Jan
1982 ï¿½ Mar, Apr, May, Jul

_Nibble_

1980 ï¿½ All issues (#1 to #8?)
1981 ï¿½ All issues (#1 to #8?)
1982 ï¿½ #1

1987 ï¿½ #9 (Sep), #10 (Oct), #11 (Nov)
1991 ï¿½ #12 (Dec)
1992 ï¿½ All issues (#1 ï¿½ Jan to #7 ï¿½ Jul)

_Family and Home Office Computing_

1988 ï¿½ April

(possibly others depending on condition)

_Questbusters_

Vol I ï¿½ All issues
Vol II ï¿½ All issues
Vol III ï¿½ #1 to #9, #12
Vol IV ï¿½ #1, #5, #11, #12
Vol V ï¿½ #11
Vol VII - #5 to #12
Vol VIII - #1, #2, #6, #8
Vol IX - #7

Thanks for your help!
Steph

>My first computer was an Atari 400 with a cassette drive.
>God I despised that keyboard! What's the technical term for that? crappy?
>bubble-something-or-another?

I didn't mind the membrane keyboard that much. Since it was the first computer I ever had, I didn't have much to compare it to. The one I had a little more sensitive than what others had (I bought it in '82). A guy I knew on the BBSs who had a 400 said that he had to use ball peen hammers to type on his. 8-)

>And the cassette drive, don't get me started.

Like the 15 minutes it took to load Zaxxon. All the copy protection they used and all it took was two cassette players to make a copy. (and they still haven't learned any lessons about copy protection).

>>"kev" <kevin@kevin.net> wrote in message

>> like the 8-bit at all and it was very expensive.

The Atari had soul. It was fun to play with. I didn't get into clones until '95 when my A2000 finally crashed. I pity all the people who had to use clones. The Atari 8-bits, ST, and Amigas were so much easier to use.

That looks so cool. But couldn't we use the more common Commodore computer?
Commodore 64 used 6510. Or maybe a VIC 20 would be easier (6502A)?

There once was an Atari 2600 adapter system announced for the VIC-20,
but to my knowledge it still only exists as hand-drawn images and
vapor. It would connect externally to the VIC, but I don't know to
what extent it would take advantage of the computer.

# 6552. MAC/65 samples?

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-29 17:22:36 UTC
From: Slor <IDoNotLike@GreenEggsAnd.Spam>
Message-ID: <b625ddf562ad73fd3de0bacc74b8434b@news.teranews.com>
Source record: 17865

I'm looking for a good source of MAC/65 sample programs. Specifically, I'd like to find some examples of graphics programming - some demo with source code perhaps. Alternatively, cc65/cc65 samples of the same nature (samples included with the package seem to be mostly geared towards C64) would also be welcome. I feel like I have the tools and background to get started on some new 8-bit development but am lacking some quality samples to get me going.

Thanks
Slor

## 6553. 130xe

I recently got one for $45 but it did not come with a manual. Came with
box, PS and mint 130xe. I am actually looking for a NEW 130XE in box. I
think $150 for one is a little high.

Tim

The best source of mac65 source I can think of is the
listings in ANALOG computing. There is also source code
for assembler at ftp://ftp.spudster.org, in a separate source
code area. The ANALOG listings would be in the magazine
area.
Other than that, there may be source code in books at
atarimagazines.com, or the book area that Kevin Savetz runs.

For single or double density 'Disk Wizard II'.
It is a boot disk. I'm sure you can find it at ftp://ftp.spudster.org
If you want DOS functions, it only works with DOS 2/2.5 type
disks (probably also SmartDOS, MyDOS).
There is also a SpartaDOS load file sector editor, don't remember
the name.
But you don't need DOS specific if you want to search for a string,
hack a game boot disk, stuff like that.

That's how I run my Atari 8 bit bbs on the net. My ISP started changing my IP address at random times, so I wrote a small program to randomly update my IP at dtdns - usually once or twice an hour. So at most my BBS is unavailable for only short periods of time, tho' if you happen to be logged in when the IP addr changes... you're knocked off. I guess it isn't perfect.

you can log on at: telnet://bfbbs.dtdns.net

I have seen such a joypad like Playstation's connecting to a Dell PC to play with Atari XL emulator and CyberStella (Atari 2600 emus). Amazes me!

It looks like this Playstation is a USB port, right?

Will it work if I use this joypad in my Dell to play those emu? Anyone know how to make it work?

Mike

Bill,

if you're still unlucky with a diagram for the 1050, take a look at my server:
(http://www.com-in.de/1050a.tif) & (http://www.com-in.de/1050b.tif)

Hope this helps...

Oliver

# 6570. Games that uses Atari 130XE memory?

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-30 09:43:10 UTC
From: mstepansky@aol.com
Message-ID: <20031230044310.16022.00001131@mb-m21.aol.com>
Source record: 17883

I still have the Atari 800xl w/ 64k (normal) but my ex-roommate in my college days used to have 130XE (64k+64k) in 1985.

But I don't understand how memory are accessed: how can 130XE access memory up to 128K?

I mean does it allow you to access like this:

64K (bank1, normal memory like in 65XE or my 800XL)
64K (separate bank2, special memory area as in 130XE) via RAMDISK

or...

64K bank1 (normal) plus a full chunk of "64k memory" bank2 (ramdisk)- to get total of 128K?

Finally, which 130XE's games that use "extra" memory of 64K ? Also, are there any game that uses 320K memory in a modified XE, if any?

BTW, "Mission of Impossibility", a nice 3D maze game, is the only game that I was able to load in and run about 382 sector long, or about 48k max in my 800xl. Next largest game I remember is the "AgentUSA", 322 sector long, about 41k. Both games are in a single "hacked" file binary format, rather the whole disk. I remember seeing a rare single pirated game like "MULE" using ridiculously high, like 412 sector, about 52k - wont work on my 800xl.

Maybe 130XE will work? Not sure....

So is it possible to run a binary game of say, 468 sector (about 60K) in XE's second memory bank (64k)?

Alternate Reality uses the extra RAM!

FWIW, the Atom didn't come with an 8271 FDC. This was an optional expansion
kit that cost more than the original computer did. Not that it matters
in this case, but I thought I'd point it out.

```
the 130xe uses bank switching to access the extra 64k.
The bits in PORTB control which bank is visible.
There are 4 16k banks that get visible at $4000 when activated.
Somebody made an extensive list of games/demos that use
extended memory, but I can't remember who.
There are very few 'old' ie. commercial, or even magazine
programs that use extra RAM. A few programs, like Bob
Puff's Disk Communicator, can use the extra RAM or not
if it isn't present.
Some cartridges do banking also, but not the $4000 kind.
I think 'Gator' used a 128k cart, and OSS Action! also did
cart bank switching, different control bits in the $Dxxx area
if I recall.
```

## 6576. Best tool/emulator for running and debugging?

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-30 20:32:46 UTC
From: yishyosh <yishyosh@hotmail.com>
Message-ID: <bssnde$59a$1@sparta.btinternet.com>
Source record: 17889

Can anyone suggest a development tool or emulator I can use when writing for 8bit atari, preferably something that will let me single-step through assembly and preview the screen. My development environment is atari 800xl (real), atari 800xl emulated and Windows XP.

What I've discovered so far:

atari800win plus 4.0 (http://www.a800win.atari-area.prv.pl/) has a built-in monitor that allows post-mortem/investigative debugging rather than development/single-step style debugging.

mess (www.mess.org) doesn't appear to have a debugger or monitor. Maybe the shipping binary didn't have it enabled at compile time, if it were it enabled could I single step though my application?

Xformer 2000 doesn't have a monitor or debugger, references to monitor in the help refer to TV configuration.

Atari++ option "trace on reset" sounds like the right thing, except the option to continue with emulation hangs.

6502 Macroassembler & Simulator (http://home.pacbell.net/michal_k/) is everything you'd want from a development environment but doesn't specifically target the atari; hence no screen preview.

cc65, ca65 and VICE also sounds like the right combination except VICE is for C64.

Ta,
Yishyosh

The 130XE utilizes a Freddie chip to help with the banking.

> to 128K?

It uses two (in the 800XL) unused pins of the PIA-PortB to map in four
additional RAM banks of 16K size each in the area $4000 to $7fff. IIRC,
these were bits 2 and 3.

> Finally, which 130XE's games that use "extra" memory of 64K ? Also, are there

DOS 2.5 provided a RAM disk in the extended memory area.

> I remember seeing a rare single pirated game like "MULE" using
> ridiculously high, like 412 sector, about 52k - wont work on my 800xl.
>
> Maybe 130XE will work? Not sure....

Unlikely.
These long games are often "autoloaders" in the sense that they provide
their own loading routines, bypassing the loading from DOS/game DOS and
expecting a certain DOS format. The DOS then loads the first couple of
sectors and then runs an INIT routine that continues loading the game,
expecting a specific sector format (typically DOS 2.0S like).

Just try to copy it to a plain 2.0S/2.5 disk and try loading it from
there with a game dos (e.g. NDOS), that might work better.

> So is it possible to run a binary game of say, 468 sector (about 60K) in XE's
> second memory bank (64k)?

Well, if the game is cleverly written, then yes. It would take some INIT
routines that would switch the banks while loading the game, or an
autoloader to do that. Clearly all possible, but I've never seen it done.

So long,
Thomas

The win or the Linux version? Sorry, the win32 version does not have the built-in monitor the Linux version provides, so there is no built-in debugging for windows, and not this option. What "TraceOnReset" basically does is that it launches the emulator monitor/debugger on a cold start, allowing to debug critical reset-routine bugs (required mostly for internal debugging of its built-in operating system, Os++).

I've three suggestions:

i) A pretty good assembly development package for the AtariXL is the Mac65/DDT cartridge. Highly recommended for any kind of professional/semiprofessional work on the Atari.

ii) Keep on nagging me. (-: I'm open to improvement requests, and to port the monitor to windows might be a suggestion worth for the next version(s). It's just that there is no good "ncurses" port for windows I'm aware of, so I got lazy and dropped the monitor for win. I basically had to write my own portable console code, and I wasn't probably not motivated enough to do it (yet). (-;

iii) Cross-development with cc65/ca65. Also highly recommendable, I've used ca65 for the os++ here again. It's a pretty good assembler if you like "assembling the Linux way". It's not an IDE (integrated development environment) but that's the way *I* like it anyhow.... (-;

So long,
Thomas

From Welcome to comp.sys.atari.8bit Quick Faq

Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-Ramdisk;

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- Bop N'Wrestle (GAME) (Mindscape)
64k, 128k 130XE-RD
(on 64k Ataris the floppy will never stand still!)

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;
(merely copies the levels into the RD and loads them from there;
if you don't want to play all 100 levels at once, 64k is enough!)

- Human Torch & The Thing Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk
(The main program or some pics will be copied to the Ramdisk)

- I.K. Plus Demo (GameDEMO) ??? (authors unknown)
a) 64k RAM only graphics;
b) 128k RAM graphics + sound;

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Questprobe featuring Spiderman - see: Spiderman;
(afaik, THE HULK does not support 128k RAM);

- Questprobe featuring Human Torch and Thing - see Human Torch;

- Spiderman Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk;
(The main program or some pics will be copied to the Ramdisk)

The game is actually called Realm of Impossibility from EA! Do you still
have this single file EXE? I would like to get a copy. (I own the original
disk too, actually two copies!)

Tim

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

# 6583. Repairing Atari Disk Images

Newsgroup: comp.sys.atari.8bit
Date: 2003-12-31 02:01:34 UTC
From: iquitted@collegeclub.com
Message-ID: <bba8af7b.0312301801.5b58e761@posting.google.com>
Source record: 17896

I have finally managed to convert all my old Atari 800XL floppy disks to disk images that I can use with an emulator. Most of them work fine, but a few of them are kind of scrambled -- when I try to view the disk directory, I'll get part of a file instead. I'm pretty sure these problems have nothing to do with the transfer to my modern computer, because I remember having the same problems on the actual Atari. So anyway, my question is, are there any Mac or PC utilities that I could use to repair my disk images? I do have an Atari program called Sherlock that I've been using, but I think something that would run natively on my computer would be more helpful.

I'm using a Macintosh, but I do have Virtual PC, if there's nothing available on Mac.

jeremy

## 6584. Cartridge storage system

Message-ID: <vv4fh0noiplt12@corp.supernews.com>
Source record: 17798

(When you try to view a directory, you get part of a file instead.)
I think that's what you said, and that you had the same problem
with a real atari.
It almost sounds like you're trying to get a directory of a SpartaDOS
disk with MyDOS or DOS 2/2.5.
Could you be more specific in describing what is happening?
I know of no utilities that will repair a bad disk image, especially
if you don't know what's wrong with it.
Maybe you could describe how you made the images.
Did you use an interface cable and sector copy disks to an
image on the PC? Or did you use some disk2atr utility?
Russg

That's one I've been wanting to talk to my boss about doing...
A good, simple, 3D shoot'em, in the vein of Star Raiders.

No promises... not my decision to make :^( But who knows?!
My boss seems into the early 80s game genre, just like me ;)

Sounds like a place I need to work for! I can't imagine much more fun than
being paid to recreate 80s-ish games...

Hi,

Anybody out there have a set of disks for the SWP ATR-8000 they would be willing to dupe for me? Will gladly reimburse reasonable amount for media costs and time. :)

Cheers.
Steve

Hi!

Does anyone have an image for one of my all time favourites, Marathon &
Maths For Fun (by English Software Company)?

I do not know how it works in this specific case with the
MULE game file you refer to, but:

Generally with Atari DOS, it is possible to arrange
a sequence of control sections and data sections within
one file, so a memory area is loaded, and later
reloaded/overwritten.

One purpose with doing this could be to display an image
or other intersting screen effects early in the loading
session, and disable/overwrite it at the end of the
loading sequence.

I really like Atari DOS, particularly version 2.5.

All in all, large file sizes (in Atari DOS) do not
necessarily require a large memory configuration in the
computer.

Hello,

I also would like copies of the disks. I have the tdo files that float around the net that are supposed to work with teledisk.exe to recreate the original disks. I can get the single density disk to work which is the CPM loader program. When I try to create the double density CPM disks, I get data reading errors and sector not found errors. I talked with Don Maslin about this and he got the same errors. I've tried every hardware combo that you can think of to create these files but the tdo images must be bad. These are the files that I tried.

01/26/1991 12:39 PM 87,522 ATR8000.TD0
01/29/1991 03:18 PM 79,326 ATR8000.ZIP
07/01/1996 02:41 PM 88,370 ATR8K382.TD0
07/01/1996 02:47 PM 66,320 ATR8K484.TD0
07/01/1996 03:20 PM 7,390 ATR8KATM.TD0
07/01/1996 03:10 PM 14,556 ATR8KBIO.TD0
07/01/1996 03:13 PM 34,734 ATR8KMDM.TD0

Thanks a lot.

Ralph

> Anybody out there have a set of disks for the SWP ATR-8000 they would be willing to dupe for me? <

Can the CPM disks be copied on an a PC (with a 360K drive), or does one need CPM running to copy the disks? What specific disks are needed? (I presume that these disks are in one of the CPM formats?)

Larry
